CSE For High Availability and System Management

ibm.com/vm/devpages/jelliott/events.html

Jim Elliott
Consulting Sales Specialist – System z
Systems & Technology Group
IBM Canada Ltd.

The New Face of Enterprise Computing
9150 – z/VM Cross System Extensions for High Availability and System Management

- Do you have more than one z/VM system? Do you want to be able to share the RACF database across your systems? Do you want to only manage one VM Directory for all the systems? Would you like to ensure that a minidisk may only be linked RW on one guest on one system, and have all the systems enforce that, and thus be able to finally get a good night's sleep? The z/VM Cross System Extensions can do all that for you, and more! Come and see how z/VM’s CSE enables you to treat separate VM systems as a single system image. Lower your system management workload, and get higher availability to boot! An actual implementation of CSE is presented showing both the benefits and pitfalls.
Topics – z/VM Cross System Extensions

- What does CSE do?
- What does CSE not do?
- How do I turn it on?
- Can I share the VM SYSRES and Spool volumes?
- How does this get me closer to High Availability?

This presentation was prepared by Jay Brenneman, who unfortunately could not be at this SHARE.
z/VM without CSE
CSE allows you to:

- Extend the mini disk access control semantics across VM nodes in a CSE cluster
- Requires a common VM Source Directory across all nodes in a CSE cluster
- Share Spool files across VM nodes in a CSE cluster
- Requires SPXTAPE DUMP and LOAD to retrofit onto existing systems
- Extend the query and messaging tools across VM nodes in a CSE cluster
CSE – XLINK – Cross System Link

- Set of bit fields on the disk in the CSE area
  - Defaults to CYL 0
CSE – XSPOOL – Shared Spool volumes

- Does not provide R/W access to other system's spool
- Lets user on VM1 read from his spool space on VM9
CSE – Cross System Messaging

- Usr1 on VM1 can smsg usr2 on VM9
- Usr1 on VM1 can Query Names at VM9
Ugly Bits: PVM and RSCS are not free

- **PVM is not included in the base cost of z/VM**
  - Requires a Special Bid to get licensed on an IFL
  - Needed for shared spooling
  - Needed for cross system messaging, query

- **DIRMAINT is required to support the single source directory**
  - Or you have to figure out some other way to guarantee that the object directories are all identical, all the time

- **RSCS is needed to support DIRMAINT communications if shared spool is not used**
  - As of z/VM 5.3 – RSCS is a feature, not a product
CSE does **NOT** allow you to:

- Share VM SYSRES volumes without extra work
  - Each VM system must maintain its own object directory, warm start area, and checkpoint
- Get High Availability for free
  - Some infrastructure will have to be built or bought
- Share SFS pools across VM systems
  - Need TSAF, CS Collection, etc
- Virtual Reserve/Release across VM systems*

* MDISK 200 3390 DEVNO nnnn MWV
### Enabling CSE – The SYSTEM CONFIG file:

Format a volume to support XLINK

- Attach the volume to your id
- XLINK FORMAT <vaddr> <volid>
  - XLINK command is split: part built in and part module
    - Module lives on MAINT's 193
  - Defaults to adding CSE tracks in CYL 0
    - <1 Cyl for mod 3, 9 cyl for mod 9 up to mod 54
- IPL to pick up SYSTEM CONFIG changes if you haven't already
- Attach the volume to SYSTEM on all VMs
- XLINK CHECK <volid>
  - Volume <volid> is controlled by CSE LINK
Shared RACF database

- Change the RACF database from minis to dedicated volumes that support Hardware Reserve/Release
  - DDR from the minis to full volumes on VM1
  - Change the directory entry and recycle RACF on VM1
  - Add VM2 missing entries to the database
  - Change the directory entry and recycle RACF on VM2
- That's pretty much it – do the same for the rest of the VM systems
RSCS configuration

- RSCS is used for DIRMAINT message passing if you're not using Shared Spool

DIRMAINT Configuration Overview

- DIRMAINT will run on one node in the VM cluster
- DirmSats will run on all other nodes in the VM cluster
- Directory changes are made everywhere
  - This can take some stern user re-education
- DIRMAINT and DirmSats must be at the same code level
  - Mixed VM level clusters take more planning and work
Directory Stuff

- Merging the directory is the hardest part of implementing CSE
- On VM1:
  - Add the system affinity information for all VM systems to the DIRECTORY control statement
  - Add SYSAFFIN statements to all guests which will have differences between systems
  - Enable DIRMAINT and make sure the lock disk (15D) is defined on XLINK controlled DASD

More Directory Stuff

- Once VM1 has SYSAFFIN statements for all systems which will be part of the VM cluster:
  - Using dirmsat as a template, create a new dirmsat user to run on each of the other VM systems: dirmsat2, dirmsat4, dirmsat5, dirmsat7, dirmsat9
  - Create a DVHPROFA DIRMSATx on DIRMAINT’s C disk for each new dirmsat user
  - Add RACF privileges for the dirmsats if needed
  - Run DIRM USER WITHPASS to consolidate the DIRMAINT files into a monolithic directory file
  - Send USER WITHPASS to each of the other VM system's MAINT users
Yet More Directory Stuff

- **On the other VM systems:**
  - Rebuild the directory with DIRECTXA using the USER WITHPASS file from VM1
  - Xautolog this system's dirmsat
  - Add the RACF privileges you forgot about when you created it

- **Add FROM= and SATELLITE_SERVER= statements to DIRMAINT Config**

  SATELLITE_SERVER= DIRMSAT9 LTICVM9
  SATELLITE_SERVER= DIRMSAT5 LTICVM5
  SATELLITE_SERVER= DIRMSAT4 LTICVM4
  SATELLITE_SERVER= DIRMSAT2 LTICVM2
  SATELLITE_SERVER= DIRMSAT1 LTICVM1

  FROM= * DEST= * S= * T= *

- Force and restart DIRMAINT on VM1 and dirmsats everywhere else
- Enjoy the utopia of CSE enabled VM

z/VM Shared SYSRES

- Rebuild VM9 on VMQ volumes
- Going to move these off the SYSRES packs:
  - Checkpoint
  - Warmstart
  - Directory
  - RW minis for service machines
**z/VM Shared SYSRES – move the checkpoint**

- **MAINT’s CF1 is going to be shared, so:**
  - In **SYSTEM CONFIG** on CF1
    
    Imbed -SYSTEM- SYSRES
    Imbed -SYSTEM- CPOWNED
  
  - In **VM9 SYSRES** on CF1
    
    System Residence,
    Warmstart Volid VM9CDS From Cylinder 10 For 9,
    Checkpoint Volid VM9CDS From Cylinder 1 For 9
  
  - In **VM9 CPOWNED** on CF1
    
    CP_Owned Slot 1 &SYSRES
    CP_Owned Slot 2 VM9CDS
  
  - Don't include multiple Directory bearing volumes for other VM systems in CPOWNED
z/VM Shared SYSRES

- **CP format VM9CDS**
  - VM9's Checkpoint, Directory, and Service Machine minis
  - Allocate checkpoint and warmstart as PERM
  - Allocate directory as DRCT
  - Allocate the space for Minis as PERM

<table>
<thead>
<tr>
<th>CYLINDER</th>
<th>ALLOCATION CURRENTLY IS AS FOLLOWS:</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>START</td>
</tr>
<tr>
<td>-------</td>
<td>-----</td>
</tr>
<tr>
<td>PERM</td>
<td>0</td>
</tr>
<tr>
<td>DRCT</td>
<td>19</td>
</tr>
<tr>
<td>PERM</td>
<td>59</td>
</tr>
</tbody>
</table>
z/VM Shared SYSRES – rebuild the checkpoint

- SPXTAPE DUMP SPOOL ALL
- IPL CLEAN
  - Trashes all spool space
  - Rebuilds the checkpoint and warmstart data
- SPXTAPE LOAD to get spool files back
z/VM Shared SYSRES – move the directory

- Update the Directory for MAINT to include a
  fullpack mini for VM9CDS at its real device
  address
- Update the DIRECTORY control block to
  point to directory space on VM9CDS

DIRECTORY 0123 3390 VM1IPL *01550-2064 LTICVM1
DIRECTORY 0123 3390 VM4IPL *10D05-2066 LTICVM4
DIRECTORY 0123 3390 VM7IPL *41550-2064 LTICVM7
DIRECTORY 0123 3390 VM2IPL *4299E-2094 LTICVM2
DIRECTORY 5502 3390 VM9CDS *4B52A-2084 LTICVM9
DIRECTORY 5623 3390 VM5CDS *168BE-2096 LTICVM5
z/VM Shared SYSRES – move the directory

- Get USER WITHPASS to VM9
- Link the fullpack minidisk for VM9CDS
- Run DIRECTXA with the flat file
  - Don’t update the allocation map after updating the directory
z/VM Shared SYSRES – xlink format

- **If the VMQ SYSRES is mod-3:**
  1. Run XLINK FORMAT to set up the CSE track on all the VMQ SYSRES volumes
  2. Add XLINK_Volume_Include VMQ* to SYSTEM CONFIG and IPL to check that the VMQ volume comes online

- **If the VMQ SYSRES is mod-9:**
  1. Add XLINK_Volume_Include VMQ* CYL xxxxx to SYSTEM CONFIG & XLINK_System_Exclude VM9
  2. IPL to pick up the change
  3. Run XLINK FORMAT to set up the CSE track on the VMQ SYSRES volume
  4. Remove XLINK_System_Exclude VM9 from SYSTEM CONFIG and IPL to check that the VMQ volume comes online
z/VM Shared SYSRES – xlink format

- Note – ANY volume labeled VMQ* without a CSE area will not be brought online, at all
- Alter the allocation map on VMQIPL to remove the directory space
- IPL to check the changes – Should see the message that the Directory on VM9CDS is on line
z/VM Shared SYSRES – move the RW minis

- Start allocating minidisks on VM9CDS for service machines that need R/W space.
- Things like: SFS pool, RACF audit logs, OPERATOR’s 191
  - Allocate them as 9xxx
  - Copy from the original to the 9xxx device
  - Flip the addresses so 9xxx is the original on the shared SYSRES volume, linked RO
  - Useful for service later
z/VM Shared SYSRES

- At this point there should be no RW links to any of the SYSRES volumes
- The directory is not on the SYSRES volume
- The checkpoint and warmstart areas are not on the SYSRES volume
- Now to add VM5 so that it's sharing the VMQ volumes
z/VM Shared SYSRES

- Create a new VM5CDS volume from VM9CDS with DDR or FlashCopy
- Turn off directory updates on VM5 by forcing DIRMSAT5
- From VM9 – change the SYSAFFIN statements for VM5’s system IDs to point to VMQ volumes
- Add a fullpack minidisk to MAINT for VM5CDS
- Update the DIRECTORY control block to point to the new volume
