

**Program Directory for
TCP/IP for z/VM®**

Level 440

Program Number 5739-A03

for Use with
z/VM Version 4 Release 4.0

Document Date: August 2003

GI10-4749-00

Note!

Before using this information and the product it supports, be sure to read the general information under "Notices" on page 117.

This program directory, dated August 2003, applies to TCP/IP for z/VM, Level 440, Program Number 5739-A03.

A form for reader's comments appears at the back of this publication. When you send information to IBM®, you grant IBM a nonexclusive right to use or distribute the information in any way it believes appropriate without incurring any obligation to you.

1.0 Introduction

This program directory is intended for the system programmer responsible for program installation and maintenance. It contains information that corresponds to the material and procedures for installation and service of the following:

- TCP/IP for z/VM

Note: It is recommended that you review this program directory in its entirety before you install or service this program, then keep this document for future reference.

The program directory contains the following sections:

- 2.0, “Program Materials” on page 4 identifies basic (and optional) TCP/IP for z/VM program materials and documentation
- 3.0, “Program Support” on page 7 describes the IBM support available for TCP/IP for z/VM
- 4.0, “Program and Service Level Information” on page 10 lists APARs (program level fixes) that have been incorporated within TCP/IP for z/VM
- 5.0, “Installation Requirements and Considerations” on page 12 identifies resources and considerations for installing and using TCP/IP for z/VM
- 6.0, “Installation Instructions” on page 38 provides detailed installation instructions for TCP/IP for z/VM
- 7.0, “Service Instructions” on page 49 provides detailed servicing instructions for TCP/IP for z/VM
- Appendix A, “TCP/IP Installation and Service Utilities” on page 77 provides information about the TCP2PROD command (supplied for placing TCP/IP for z/VM files into production), its related CATALOG files, and other TCP/IP service aids
- Appendix B, “Modifying TCP/IP for z/VM CATALOG Files” on page 89 provides information about how to use VMSES/E local modifications to alter TCP/IP for z/VM CATALOG files
- Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93 presents considerations for changes that affect the installation (and service of) TCP/IP for z/VM
- Appendix D, “Making Local Modifications to TCP/IP for z/VM Modules” on page 95 provides information to help you implement local modifications to TCP/IP for z/VM modules
- Appendix E, “Modifying TCP/IP for z/VM VMNFS Code” on page 105 provides information specific to TCP/IP NFS server module local modifications
- Appendix F, “TCP/IP for z/VM Build Lists” on page 107 provides information about the VMSES/E build lists used to maintain TCP/IP for z/VM
- Appendix G, “Moving TCP/IP for z/VM to SFS Directories” on page 109 provides instructions for changing the TCP/IP for z/VM service environment to use Shared File System directories instead of default minidisks
- Appendix H, “Copying TCP/IP for z/VM Client Code to the Y-Disk” on page 114 provides considerations and optional instructions for copying client files to the system Product Code minidisk

Obtaining Updated Planning Information

Before you install TCP/IP for z/VM, read 3.1, “Preventive Service Planning” on page 7. This section describes how to obtain any updates to the information and procedures presented within this program directory.

1.1 Program Description

TCP/IP (Transmission Control Protocol/Internet Protocol) enables z/VM customers to participate in a multivendor, open networking environment using the TCP/IP protocol suite for communications and interoperability. The applications included in TCP/IP provide the ability to transfer files, send mail, log on a remote host, allow access from any other TCP/IP node in the network, and perform other network client and server functions.

Transmission Control Protocol/Internet Protocol for z/VM, Level 440, (TCP/IP for z/VM) contains the functions provided by TCP/IP for z/VM, Level 430, and provides the following enhancements:

- Expanded TCP/IP (*stack*) protocol server performance improvements which optimize high-use paths, improve algorithms, and implement other performance-related features. With these enhancements, existing server behavior is maintained while achieving higher performance, especially in environments where the TCP/IP stack acts as a host for VM-based clients and servers.

With these changes, Multi-Processor (**MP**) support has been added to the TCP/IP server which allows individual *real* devices to be associated with particular virtual processors, to facilitate improved performance and throughput management.

- IEEE Virtual Local Area Network (VLAN) support enhancements that allow:
 - TCP/IP for z/VM to enable membership in a VLAN when using OSA-Express QDIO and HiperSockets adapters that support IEEE 802.1q
 - z/VM *virtual* QDIO and HiperSockets network interfaces to support VLAN frame tagging, as described in IEEE 802.1q
 - management and control of VLAN Identifiers (VIDs) that can be used by guest virtual machines.
- User Authentication for the IMAP server can now be performed via an exit that makes use of a separate virtual machine (IMAPAUTH). This support removes prior user ID and password length restrictions, and allows IMAP services to be used without the need to assign a VM user ID and password to each IMAP mail client
- TCP/IP stack security improvements that include:
 - logging of all TCP/IP administrative commands that alter, or attempt to alter, the active IP or CP configuration
 - port handling and reservation changes, that include use of the **RESTRICTLOWPORTS** operand of the **ASSORTEDPARMS** statement on a default basis.

- The SSL server implementation has been repackaged to use the Red Hat Package Manager (**RPM**) for installation of Linux-based components, and can now be used with the following SuSE Linux distributions:
 - SuSE Linux 2.4.7 SLES 7
 - SuSE Linux 2.4.19 SLES 8
- Additional CMS HELP files have been added for various TCP/IP commands; further, all such HELP files are now installed to the z/VM system HELP disk
- Miscellaneous documentation improvements
- Incorporation of miscellaneous service APARs for previous IBM TCP/IP for VM releases.

2.0 Program Materials

An IBM program is identified by a program number. The program number for TCP/IP for z/VM is 5739-A03.

The z/VM Version 4 Release 4.0 program announcement material provides detailed information about features supported by TCP/IP for z/VM. If you have not already received a copy of this information, contact your IBM marketing representative.

The following sections identify:

- basic and optional program materials that are applicable to this program
- publications useful during installation and service.

2.1 Basic Machine-Readable Material

TCP/IP for z/VM is distributed as part of the z/VM Version 4 Release 4.0 System DDR. Refer to the *IBM z/VM V4.4 Improves Virtualization Capabilities for Linux on zSeries* Software Announcement, 203-128, for information about ordering z/VM Version 4 Release 4.0 and its features.

2.2 Optional Machine-Readable Material

There are no features or optional machine-readable materials associated with TCP/IP for z/VM.

2.3 Program Publications

The following sections identify the basic publications associated with TCP/IP for z/VM. There are no optional publications for this component of z/VM.

2.3.1 Basic Program Publications

Publications associated with TCP/IP for z/VM are listed in Figure 1:

Figure 1 (Page 1 of 2). Basic Material: Unlicensed Publications

Publication Title	Form Number
z/VM: TCP/IP Level 440 Planning and Customization	SC24-6019
z/VM: TCP/IP Level 440 User's Guide	SC24-6020
z/VM: TCP/IP Level 440 Programmer's Reference	SC24-6021
z/VM: TCP/IP Level 440 Messages and Codes	GC24-6022

Figure 1 (Page 2 of 2). Basic Material: Unlicensed Publications

Publication Title	Form Number
z/VM: TCP/IP Level 440 Diagnosis Guide	GC24-6023

One copy of the following program publication is provided at no charge to licencees of TCP/IP for z/VM:

- z/VM: TCP/IP Level 440 Planning and Customization (SC24-6019)

2.3.2 Softcopy Publications

TCP/IP for z/VM softcopy publications are provided as part of the *VM Collection* libraries on CD-ROM (SK2T-2067). In addition, softcopy publications are available at the TCP/IP for z/VM home page on the World Wide Web; the URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

2.4 Program Source Materials

No viewable program listings are provided for TCP/IP for z/VM.

2.5 Publications Useful During Installation and Service

The publications listed in Figure 2 may be useful during the installation and servicing of TCP/IP for z/VM. To order copies, contact your IBM representative.

Figure 2 (Page 1 of 2). Publications Useful During Installation / Service on z/VM Version 4 Release 4.0

Publication Title	Form Number
z/VM: TCP/IP Level 440 Planning and Customization	SC24-6019
z/VM: TCP/IP Level 440 User's Guide	SC24-6020
z/VM: Guide for Automated Installation and Service	GC24-6064

z/VM: System Messages and Codes - Other Components	GC24-6032

3.0 Program Support

This section describes the IBM support available for TCP/IP for z/VM.

3.1 Preventive Service Planning

Before you install TCP/IP for z/VM, check with your IBM Support Center or use IBMLink™ to determine if Preventive Service Planning (PSP) information is available that you should know. To obtain this information, specify the appropriate UPGRADE and SUBSET values listed in Figure 3:

Figure 3. PSP Upgrade and Subset ID

RETAIN™				
COMPID	Release	Upgrade	Subset	Component Name
5735FAL00	440	TCPIP440	VM440	TCP/IP for z/VM
5735FAL00	440	TCPIP440	<i>yynn</i> RSU	RSU Service Recommendations

RSU-BY-LVL information can be obtained from the VM service RSU web site at this URL:

<http://www.ibm.com/eserver/zseries/zvm/service/rsu>

3.2 Statement of Support Procedures

With TCP/IP for z/VM, you are entitled to support under the basic warranty for z/VM Version 4 Release 4.0. Also, note that z/VM Software Subscription and Support is *automatically* added when you order z/VM — this provides zSeries service to which you are likely accustomed.

Note: You must take specific action when you order z/VM to decline z/VM Software Subscription and Support.

Report any difficulties you have using this program to your IBM Support Center. If an APAR (Authorized Program Analysis Report) is required, the Support Center will provide the address to which any needed documentation can be sent.

Figure 4 identifies IBM RETAIN information — the Component ID (COMPID), Release, and Field Engineering Service Number (FESN) — that corresponds to TCP/IP for z/VM:

Figure 4. Component IDs

RETAIN			
COMPID	Release	Component Name	FESN
5735FAL00	440	TCP/IP for z/VM	0461035

3.3 Service Information

The IBM Software Support Center provides telephone assistance for problem diagnosis and resolution. You can call the IBM Software Support Center at any time; you will receive a return call within eight business hours (Monday—Friday, 8:00 a.m.—5:00 p.m., local customer time). The number to call is:

1-800-426-7378 (or, **1-800-IBM-SERV**)

Outside of the United States or Puerto Rico, contact your local IBM representative or your authorized supplier.

Various installation and service-related items, such as the Preventive Service Planning (PSP) “bucket” and current RSU status/content information, are available at the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

3.3.1 Problem Documentation

When working with TCP/IP for z/VM support personnel on problems associated with an active Problem Management Record (PMR), diagnostic information may occasionally be requested. In such cases, the support staff will work with you to determine how to best provide any requested documentation. For reference, addresses that can be used to submit various documentation formats are listed in this section.

Note: The addresses that follow should not be used as a problem reporting facility. All requests for problem assistance must be processed through the IBM Software Support Center, as previously described. Documentation submitted to any of these addresses will be reviewed only if it is associated with an active PMR.

Figure 5. Problem Documentation Addresses

Format	Address
Internet	vmtcpdoc@vnet.ibm.com
IBMLink	GDLVM7(TCPLVL2)
Carrier Service	IBM Corporation Attention: <i>IBM contact name</i> Dept. G79G 1701 North St. Endicott, NY 13760

3.3.2 Communicating Your Comments to IBM

If you have comments about or suggestions for improving the TCP/IP for z/VM program product, or this Program Directory, please provide them to IBM through one of the following means:

- If you prefer to send comments by mail, use the address provided with the Reader's Comments form (RCF) at the back of this document
- If you prefer to send comments electronically, use this Internet e-mail address:

vmtcpip@vnet.ibm.com

If you send documentation-related comments, please include:

- the title of this publication
- the section title, section number, or topic to which your comment applies.

4.0 Program and Service Level Information

This section identifies the program level and any relevant service levels of TCP/IP for z/VM. In this context, *program level* refers to APAR fixes incorporated within the TCP/IP for z/VM program; *service level* refers to PTFs that are supplied with this product. Information about the TCP/IP for z/VM cumulative service tape is provided as well.

4.1 Program Level Information - TCP/IP for z/VM

APAR fixes (for previous levels of IBM TCP/IP for VM) that have been incorporated into this level of TCP/IP for z/VM are:

PQ55265	PQ57163	PQ58116	PQ58524	PQ58882	PQ59871	PQ59998	PQ60040
PQ60220	PQ60221	PQ60303	PQ60532	PQ60539	PQ60541	PQ60542	PQ60823
PQ60988	PQ61267	PQ61269	PQ61270	PQ61509	PQ61764	PQ61892	PQ62128

PQ73391	PQ73955	PQ74026	PQ74664	PQ74771			

4.2 Service Level Information

Before you install and configure TCP/IP for z/VM, you should review the TCPIP440 PSP (Preventive Service Planning) “bucket” for updated installation information that you should be aware of, or for information about PTFs that should be installed. Specify upgrade and subset values of **TCPIP440** and **VM440**, respectively, when you request or obtain this information.

4.3 Cumulative Service (RSU) Tape Information

Cumulative service for TCP/IP for z/VM is available through a periodic, preventive service tape, the Recommended Service Upgrade (RSU). The RSU tape is used to provide service updates for multiple z/VM components (including TCP/IP for z/VM) and is often referred to as a *stacked* RSU tape.

The current-level of the stacked z/VM RSU can be obtained using the information provided in Figure 6:

Figure 6. Cumulative Service (RSU) Tape Information

RETAIN		
COMPID	Release	PTF
568411202	RSU	UM97440

Note: Current RSU status and content information is available at the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

5.0 Installation Requirements and Considerations

The following sections identify system requirements for installing TCP/IP for z/VM.

5.1 Hardware Requirements

There are no special hardware requirements to install TCP/IP for z/VM. Additional hardware requirements for exploiting specific functions of TCP/IP for z/VM are documented in the announcement material and in *z/VM: TCP/IP Level 440 Planning and Customization (SC24-6019)*.

5.2 Program Considerations

The following sections list programming considerations for installing TCP/IP for z/VM.

5.2.1 Operating System Requirements

TCP/IP for z/VM requires the following operating system:

- z/VM Version 4 Release 4.0
- CMS Level 20

5.2.2 Other Program Product Requirements

5.2.2.1 Other Program Product Requirements - TCP/IP for z/VM

IBM C/C++ for z/VM (5654-A22) has been used to build the C components that provide the TCP/IP services listed here. The Language Environment® for z/VM (supplied as an installed component of z/VM Version 4 Release 4.0) is necessary to use these services:

- Domain Name Server virtual machine (NAMESRV)
- Internet Message Access Protocol server (IMAP)
- Multiple Protocol ROUTE server (MPROUTE)
- Network Data Base servers (NDBPMGR and NDBSRV nn)
- Portmapper server (PORTMAP)
- Remote Execution daemon (REXECD and RXAGENT n)
- RouteD server (ROUTED)
- SNMP Query Engine and Agent (SNMPD and SNMPQE)
- Sockets Applications Programming Interface
- Network File System server (VMNFS)
- Kerberos Authentication and Administrator Servers (VMKERB and ADMSERV)

Various client functions require Language Environment for z/VM support as well. Representative of these are:

- CMSRESOL and CMSRESXA
- DIG
- NFS (client)
- NSLOOKUP
- RPCGEN and RPCINFO
- NDBSRVS

Note: By default, the code for the above services is installed when you install TCP/IP for z/VM, regardless of whether you intend to use all, or only a subset, of these services.

Additional software requirements for exploiting specific TCP/IP for z/VM functions are documented in the announcement material and in *z/VM: TCP/IP Level 440 Planning and Customization* (SC24-6019).

5.2.2.2 Other Program Product Requirements - SSL Server

To use the Secure Socket Layer (SSL) server, a suitably configured Linux kernel and file system must be installed on your z/VM system. Information about Linux requirements and preparing Linux for use with the SSL server is available at the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

5.2.3 Program Installation/Service Considerations

This section describes items that should be considered before you install or service TCP/IP for z/VM

- VMSES/E is required to install and service this product.
- If multiple users install and maintain licensed products on your system, you may encounter problems when you attempt to gain write access to the Software Inventory (MAINT 51D) minidisk. Write access contention to this minidisk can be eliminated by converting the Software Inventory to use CMS Shared File System (SFS) directories instead of minidisks. See the *z/VM: VMSES/E Introduction and Reference*, Chapter 18, “Changing the Software Inventory to an SFS Directory,” for information about how to make this change.
- TCP/IP for z/VM is supplied with two IBM-defined components. When you perform installation and service tasks, you need to make use of the appropriate TCP/IP component, based on whether the installation and service environment is maintained using minidisks (the default) or using Shared File System (SFS) directories. Select and use the appropriate component for your environment from those listed here: environment.

The IBM-defined components for TCP/IP for z/VM are:

- | | |
|-----------------|---------------------------------------------------------------------------------|
| TCPIP | Used if TCP/IP for z/VM is installed and serviced using minidisks |
| TCPIPSFS | Used if TCP/IP for z/VM is installed and serviced using the Shared File System. |

Note! Minidisk Requirement

Certain minidisks **must** be defined and used with TCP/IP server machines, even when TCP/IP for z/VM service minidisks are converted to Shared File System directories. This requirement is explained further in item 5 of 5.3, "DASD Storage and User ID Requirements" on page 28.

- On occasion, you may need to perform additional installation or service processing steps to account for problems or errors that cannot be corrected through conventional means. If such steps are required, appropriate explanatory notes and text will be provided in updated levels of this document.
- TCP/IP for z/VM source files are supplied in packed format. Use the CMS COPYFILE command (with its UNPACK option) to unpack TCP/IP source files prior to their use.
- To use the Secure Socket Layer (SSL) server, a suitably configured Linux kernel and file system must be installed on your z/VM system. Information about Linux requirements and preparing Linux for use with the SSL server is available at the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

5.2.4 Migration Considerations

This section provides general information about changes to TCP/IP for z/VM that you should be aware of prior to its installation and use. The changes described herein are presented on a level-to-level basis, and grouped with respect to these topics:

- Packaging
- General TCP/IP Usage
- FTP Client
- Printing
- General TCP/IP Server Configuration
- DNS Server
- FTP Server
- IMAP Server
- Kerberos Server
- MPROUTE Server
- RouteD Server
- Remote Execution Services
- SMTP Server
- SSL Server
- **TCP/IP (Stack) Server**

TCP/IP Port Restriction Defaults Have Changed

Ensure you review the information presented in 5.2.4.15, “TCP/IP (Stack) Server” on page 25, which discusses the **RESTRICTLOWPORTS** default change introduced with TCP/IP Level 440.

For the most part, these changes have been implemented to accommodate the introduction of new functions and improvements to existing functions. In some cases, existing functions may have been removed or replaced by alternative functions.

Note: TCP/IP Level 440 is supported on corresponding releases of CP and CMS only.

5.2.4.1 Packaging

5.2.4.1.1 General Information About TCP/IP Level 440

- TCP/IP Level 440 is included as a pre-installed component of the z/VM product; its use is governed by your license for z/VM.
- TCP/IP Level 440 is **not** separately orderable from the z/VM product, although it is serviced separately from z/VM.
- TCP/IP Level 440 RSU service is provided as part of a *stacked* z/VM RSU, and not as a separately orderable RSU.
- This level of TCP/IP relies on the presence of certain functions in CP and CMS. Abends and incorrect results are possible if you attempt to use it with an older level of CP or CMS.

- TCP/IP softcopy publications are provided in the same manner as other z/VM softcopy publications, and are included with these z/VM publications.

5.2.4.1.2 Changes Introduced in TCP/IP Level 440

- The **Pascal**-based client and server functions supplied with TCP/IP Level 440 (for example, FTP MODULE or SMTP MODULE) are **not backward compatible** with prior-level TCP/IP “stack” servers, due to internal control block changes that have been implemented in this level of TCP/IP.

Conversely, in some cases, it *may* be possible to use older Pascal-based functions in concert with a TCP/IP Level 440 “stack” module. However, such use may result in client “hang” situations or other unexpected results.

To alert TCP/IP administrators of conditions in which a client-stack mismatch may be relevant, the TCP/IP stack will produce **DTCREQ076I** and **DTCREQ077I** console messages on a default basis. In the event the volume of such messages is too great, the **NOLEVELWARNING** operand of the **ASSORTEDPARMS** statement can be used to suppress these messages.

For a summary of TCP/IP Level 440 Pascal component compatibility, see Figure 7.

<i>Figure 7. TCP/IP Level 440 Pascal Module Compatibility</i>		
	TCP/IP Level 440 Pascal Functions	Prior-level TCP/IP Pascal Functions
TCP/IP Level 440 Stack Server	Compatible	Not Recommended
Prior-level TCP/IP Stack Server	Not Compatible	Compatible

- The **C**-based client and server functions supplied with TCP/IP Level 440 rely upon the Language Environment for z/VM run-time library that is provided with z/VM Version 4 Release 4.0. Because this library resides on the z/VM Product Code minidisk (typically the MAINT 19E minidisk, or **Y-disk**), changes to local procedures and modifications may be required to ensure this library is used in conjunction with TCP/IP services.

For example, if the VMLINK command is currently used to acquire Language Environment support minidisks for using TCP/IP services, it may no longer be necessary to use this command for such a purpose. Similarly, the use of :vmlink. tags within a customized **DTCPARMS** file may no longer be required.

- TCP/IP CMS Help files are now maintained separately from other TCP/IP for z/VM client files. With this change, these help files are now placed into production on the z/VM Product HELP disk (MAINT 19D, or its equivalent).
- Linux-based components of the SSL server implementation are now provided using RPM-format files, which are maintained on a newly introduced TCP/IP service build disk. When the SSL server is configured for use, the appropriate RPM package file must be retrieved from this disk and then installed on the intended Linux guest by using the Red Hat Package Manager (RPM).

The DASD requirements for the SSL Server have also been modified, to allow for more flexibility in how the required Linux guest services are provided. As a result of these changes, SSL-specific binary system files are no longer required (or provided) with TCP/IP for z/VM.

- The z/VM Version 4 Release 4.0 system directory entries for each TCP/IP for z/VM service virtual machine now include Read-only LINK statements for the 4TCPIP40 491 and 492 minidisks. These minidisk links have been added to better facilitate the testing of newly applied service.
- An IMAPAUTH user ID and a corresponding 191 minidisk have been added to the default installation, for supporting the (optional) IMAP User Authentication Exit introduced with this level of TCP/IP for z/VM.

5.2.4.1.3 Changes Introduced in TCP/IP Level 430

- The **Pascal**-based client and server functions supplied with TCP/IP Level 430 (for example, FTP MODULE or SMTP MODULE) are **not backward compatible** with prior-level TCP/IP “stack” servers, due to internal control block changes that have been implemented in this level of TCP/IP. Conversely, it should be possible to use older Pascal-based functions in concert with a TCP/IP Level 430 “stack” module in most environments.

For a summary of TCP/IP Level 430 Pascal component compatibility, see Figure 8.

Figure 8. TCP/IP Level 430 Pascal Module Compatibility

	TCP/IP Level 430 Pascal Functions	Prior-level TCP/IP Pascal Functions
TCP/IP Level 430 Stack Server	Compatible	Compatible
Prior-level TCP/IP Stack Server	Not Compatible	Compatible

5.2.4.1.4 Changes Introduced in TCP/IP Level 420

- TCP/IP Level 420 is included as a pre-installed component of the z/VM product; its use is governed by your license for z/VM.
- TCP/IP Level 420 is **not** separately orderable from the z/VM product, although it is serviced separately from z/VM.

5.2.4.1.5 Changes Introduced in TCP/IP Level 410

- TCP/IP for z/VM is no longer a priced feature of z/VM Version 4 Release 4.0. No action is required to activate (enable) this component of z/VM.
- The TCP/IP NFS Server Feature for z/VM is no longer a priced feature of TCP/IP for z/VM. No action is required to activate (enable) the TCP/IP NFS server.
- The TCP/IP Source Feature for z/VM is no longer a priced feature of TCP/IP for z/VM. TCP/IP for z/VM source files are now supplied and installed as part of the z/VM Version 4 Release 4.0 System DDR.

5.2.4.1.6 Changes Introduced in TCP/IP Level 3A0

- DES Kerberos functions are now incorporated in the base TCP/IP Feature for z/VM (non-DES Kerberos functions are no longer available). Therefore, customers who have a Kerberos database that was created in a non-DES environment **must** delete and then rebuild that database using the supplied DES Kerberos functions. Refer to the chapter titled “Configuring the Kerberos Server” in *z/VM: TCP/IP Level 440 Planning and Customization* for more information about building the Kerberos database.
- The various servers and code that provide support for the Network Computing System (NCS) are no longer provided.
- The installation user ID-owned “Sample” (2C2) minidisk and its corresponding sample files are no longer provided. The sample files provided on this disk in prior levels of TCP/IP can be obtained via the IBM TCP/IP for VM Internet home page, for which the URL is:

<http://www.vm.ibm.com/related/tcpip/>

5.2.4.1.7 Changes Introduced in TCP/IP Function Level 310

- TCP/IP-based user e-mail functions are included in CMS. TCP/IP-specific versions of NOTE and SENDFILE are **not** provided with the TCP/IP Feature for z/VM.
- A subset of RSCS Version 3 Release 2 function is available with the z/VM product to provide enhanced TCP/IP client and server print capabilities. RSCS functions not related to TCP/IP printing enhancements require a separate RSCS license for use. Refer to the *RSCS Version 3 Release 2 Program Directory* for additional information.
- Non-DES Kerberos functions are included in the base TCP/IP Feature for z/VM. DES Kerberos functions are available as a separate feature that must be separately installed.

5.2.4.2 General TCP/IP Usage

5.2.4.2.1 Changes Introduced in TCP/IP Level 440

- The **Pascal**-based client and server functions supplied with TCP/IP Level 440 (for example, FTP MODULE or SMTP MODULE) are **not backward compatible** with prior-level TCP/IP “stack” servers, due to internal control block changes that have been implemented in this level of TCP/IP.

Conversely, in some cases, it *may* be possible to use older Pascal-based functions in concert with a TCP/IP Level 440 “stack” module. However, such use may result in client “hang” situations or other unexpected results.

To alert TCP/IP administrators of conditions in which a client-stack mismatch may be relevant, the TCP/IP stack will produce **DTCREQ076I** and **DTCREQ077I** console messages on a default basis. In the event the volume of such messages is too great, the **NOLEVELWARNING** operand of the **ASSORTEDPARMS** statement can be used to suppress these messages.

For a summary of TCP/IP Level 440 Pascal component compatibility, see Figure 7 on page 16.

- The **C**-based client and server functions supplied with TCP/IP Level 440 rely upon the Language Environment for z/VM run-time library that is provided with z/VM Version 4 Release 4.0. Because this

library resides on the z/VM Product Code minidisk (typically the MAINT 19E minidisk, or **Y-disk**), changes to local procedures and modifications may be required to ensure this library is used in conjunction with TCP/IP services.

For example, if the VMLINK command is currently used to acquire Language Environment support minidisks for using TCP/IP services, it may no longer be necessary to use this command for such a purpose. Similarly, the use of `:vmlink.` tags within a customized **DTCPARMS** file may no longer be required.

- The **NETSTAT** command has been modified to produce nonzero return codes to aid in distinguishing command processing errors when they arise. Thus, local applications that utilize NETSTAT commands may require modification to interrogate and account for return codes other than zero. Details about **NETSTAT** return codes and the reasons for them can be found in the *z/VM: TCP/IP Level 440 User's Guide*.

5.2.4.2.2 Changes Introduced in TCP/IP Level 430

- The **Pascal**-based client and server functions supplied with TCP/IP Level 430 (for example, FTP MODULE or SMTP MODULE) are **not backward compatible** with prior-level TCP/IP “stack” servers, due to internal control block changes that have been implemented in this level of TCP/IP. Conversely, it should be possible to use older Pascal-based functions in concert with a TCP/IP Level 430 “stack” module in most environments.

For a summary of TCP/IP Level 430 Pascal component compatibility, see Figure 8 on page 17.

5.2.4.2.3 Changes Introduced in TCP/IP Level 420

- TCPIP has been changed to recognize a TCP/IP loopback address of *only* **127.0.0.1**. TCPIP no longer supports an alternative loopback address of 14.0.0.0.

Existing TCPIP DATA files should be reviewed for **NSINTERADDR** statements that currently include a 14.0.0.0 loopback address. All such statements should be modified to instead make use of the conventional 127.0.0.1 address that is now supported/in use.

5.2.4.3 FTP Client

5.2.4.3.1 Changes Introduced in TCP/IP Level 430

- The FTP client includes support for a **WIDTH** command option that allows more user control over how FTP console output is formatted.

5.2.4.3.2 Changes Introduced in TCP/IP Level 3A0

- The FTP client includes support for the **SIZE** subcommand, which allows a client to obtain the size of a file before it is retrieved.

5.2.4.3.3 Changes Introduced in TCP/IP Function Level 320

- The FTP client has been enhanced to make use of login information present in a NETRC DATA file. By default, when a connection is made to a foreign host, user ID and password information in the NETRC DATA file that is specific to that host are used as part of an automatic FTP login process.

Automatic FTP login can be suppressed using the new **NONETRC** option, or through use of the new **NETRC** subcommand.

5.2.4.4 Printing

5.2.4.4.1 Changes Introduced in TCP/IP Function Level 310

- The LPR command can now route print files to RSCS for printing, freeing a user's virtual machine for other work. This may introduce the need for users to learn a limited set of RSCS commands in order to determine the status of their print files. Refer to the *z/VM: TCP/IP Level 440 User's Guide* for more information.
- RSCS can be used instead of LPSERVE to provide enhanced printer daemon (LPD) capabilities. The operation and administration characteristics of RSCS are very different from LPSERVE. Refer to the chapter titled "Configuring the RSCS Print Server" in *z/VM: TCP/IP Level 440 Planning and Customization* for more information.

5.2.4.5 General TCP/IP Server Configuration

5.2.4.5.1 Changes Introduced in TCP/IP TCP/IP Level 440

- The C-based client and server functions supplied with TCP/IP Level 440 rely upon the Language Environment for z/VM run-time library that is provided with z/VM Version 4 Release 4.0. Because this library resides on the z/VM Product Code minidisk (typically the MAINT 19E minidisk, or **Y-disk**), changes to local procedures and modifications may be required to ensure this library is used in conjunction with TCP/IP services.

For example, if the VMLINK command is currently used to acquire Language Environment support minidisks for using TCP/IP services, it may no longer be necessary to use this command for such a purpose. Similarly, the use of `:vmlink.` tags within a customized **DTCPARMS** file may no longer be required.

5.2.4.5.2 Changes Introduced in TCP/IP Function Level 310

- Separate server initialization execs (TCPIPXIT, FTPDEXIT, etc.) are no longer used. All server parameters and features are controlled by entries contained in a DTCPARMS file. There is support for you to supply an exit which is specific to a particular server, or an exit that is used by all servers, for customization needs that cannot be met using a customized SYSTEM DTCPARMS file.
- Changing server names (when defining a second set of TCP/IP servers, for example) no longer requires changes to IBM-provided execs. All information related to the user ID of a particular server is kept in the TCPIP DATA file, or is part of the server configuration and is maintained in the DTCPARMS file.
- External Security Manager (ESM) interfaces have been standardized across all servers. The RPIUCMS command is used to initialize the RACROUTE environment, and RPIVAL is used to validate user IDs and passwords supplied by clients. These commands can be changed using a customized SYSTEM DTCPARMS file.

- The ESM environment is automatically established for a server when `:ESM_Enable.YES` is specified for that server in a customized SYSTEM DTCPARMS file.

Refer to the chapter titled “TCP/IP Server Configuration” in *z/VM: TCP/IP Level 440 Planning and Customization* for more information.

5.2.4.6 DNS Server

5.2.4.6.1 Changes Introduced in TCP/IP Level 3A0

- The use of a cache file (as used with a CACHINGONLY name server configuration) has been expanded to the PRIMARY and SECONDARY configurations. A new **ROOTCACHE** statement allows a cache file to be specified in a manner similar to that which can be specified on the CACHINGONLY statement. A corresponding sample root cache file, NSMAIN SCACHE, supplies several configuration recommendations, a list of root name servers, and the Internet site from which the most current list can be obtained.
- A **FORWARDERS** statement has been added to improve name resolution capability for z/VM hosts which are connected to other hosts that provide network firewall services. This statement can be used to identify other name server hosts which can perform name resolution outside the firewall system.
- The algorithms used in the caching subsystem have been improved to facilitate faster access to cached information and to more quickly determine when cached information does not exist.

5.2.4.7 FTP Server

5.2.4.7.1 Changes Introduced in TCP/IP Level 3A0

- The FTP server has been modified such that it can now process more than 256 concurrent connections. The maximum number of connections possible is governed by available virtual storage within the server.

5.2.4.7.2 Changes Introduced in TCP/IP Level 3A0

- The FTP server now makes use of a server-specific configuration file (**SRVRFTP CONFIG** by default) for its startup information, in a manner more consistent with other TCP/IP servers. Therefore, **:parms.** entries within the DTCPARMS file that are associated with the FTP server need be modified to account for this change. Any SRVRFTP operands currently specified using a `:parms.` entry need to be removed, with appropriate modifications made to either the FTP server configuration file or the DTCPARMS file (for example, to account for use of the ANONYMOU or RACF command operands).
In addition, the FTP server no longer makes use of the client-oriented FTP DATA file.
- The FTP server has been enhanced to better accommodate web browser and graphical FTP clients. Changes for this support include the ability to provide UNIX-format list information in response to client DIR subcommand requests, through the use of the **LISTFORMAT** configuration statement. In addition, the **AUTOTRANS** statement can be used to configure the server to perform automatic EBCDIC-ASCII data translation for transferred files, based on file types (or, file extensions), as determined by **VMFILETYPE** statements which are maintained in the TCPIP DATA file.

- Support for **AUTOTRANS** and **LISTFORMAT** operands to client-supplied SITE subcommands has been implemented as well, to provide client control over automatic EBCDIC-ASCII data translation and list information formats.
- **AUTOTRANS** and **LISTFORMAT** characteristics can now be established when specific FTP users login, when the CHKIPADR exit exec is customized for use.
- Support for additional SMSG interface commands has been added to allow for dynamic server configuration changes, console and tracing control, and shutdown/restart capability.

5.2.4.7.3 Changes Introduced in TCP/IP Function Level 320

- The FTP server has been enhanced to exploit new CP and CMS user authorization facilities provided with VM/ESA Version 2 Release 4.0. These enhancements allow an FTP user to access minidisks they own without the need for minidisk passwords to be defined or supplied during an FTP session. Thus, the link results achieved when FTP users access minidisk resources may noticeably differ from those seen using prior levels of TCP/IP for VM.

For example, if a user establishes a read-only link to a minidisk (through the use of an explicit "**ACCT read_password**" command), a subsequent PUT command that initiates a write request to that minidisk may now succeed *if* the login user ID owns the minidisk in question. By comparison, with a prior TCP/IP level, such a request would cause an FTP user to be prompted to supply a Read/Write (or Multiple Read) password through use of the **ACCT** subcommand in order to first gain write access to the minidisk.

The use of these new user authorization facilities also allows users with LOGONBY authority for a given *base* virtual machine to exercise that same authority during an FTP session. This is accomplished through use of the CP Diagnose X'88' command by the FTP server, which allows access to *base* user ID resources without requiring the password for that *base* user ID to be supplied. This kind of access is achieved through use of a new *"/BY/byuser_id"* parameter of the FTP **USER** subcommand. Additionally, the CP directory entry for the FTP server must include an OPTION DIAG88 statement, to allow use of the Diagnose X'88' command.

- FTP virtual reader support has been added, which allows an FTP client to use the virtual reader of a VM user ID as the current directory. For such users to issue DELETE and DIR or LS commands against a reader directory, the FTP server virtual machine must have class D privileges. To allow user to PUT files to a reader directory, the **RDR** parameter must be included with the FTP server startup command, SRVRFTP.

5.2.4.8 IMAP Server

5.2.4.8.1 Changes Introduced in TCP/IP Level 440

- Support for an IMAP User Authentication Exit is introduced, which removes the restriction that all IMAP users who are enrolled in the IMAP mail store must have a VM user ID and password. With this support, eight-character limits on user ID and password values are also removed, which allows registered IMAP clients to use IMAP services without knowledge (or restrictions imposed by) the VM IMAP implementation.

The IMAP User Authentication Exit is activated by including a new **AUTHENTICATEID** statement in the IMAP server configuration file (IMAP CONFIG). A sample authentication exit exec is provided as **IMAPAUTH SEEXEC**. The exit itself runs in a server virtual machine that is separate from the IMAP server; this additional server is named **IMAPAUTH**, by default.

A new IMAP administrative command, **IMAPADM SETTINGS**, is also now supported. This command provides information about current IMAP server attributes and settings.

5.2.4.9 Kerberos Server

5.2.4.9.1 Changes Introduced in TCP/IP Level 3A0

- The non-DES Kerberos functions that were provided with previous levels of IBM TCP/IP for VM are no longer available. Instead, only a DES Kerberos system is supported, with the DES Kerberos functions incorporated as part of the TCP/IP Feature for z/VM.

Any Kerberos database that was created in a non-DES environment will not work with the DES Kerberos functions supplied as part of TCP/IP Feature for z/VM. The existing non-DES Kerberos database **must** be deleted and then rebuilt using the supplied DES Kerberos functions. Refer to the chapter titled “Configuring the Kerberos Server” in *z/VM: TCP/IP Level 440 Planning and Customization* for more information about building the Kerberos database.

5.2.4.10 MPROUTE Server

5.2.4.10.1 Changes Introduced in TCP/IP Level 3A0

- The MPROUTE and RouteD servers cannot be concurrently used with the same TCP/IP stack server.

5.2.4.11 RouteD Server

5.2.4.11.1 Changes Introduced in TCP/IP Level 3A0

- The RouteD and MPROUTE servers cannot be concurrently used with the same TCP/IP stack server.

5.2.4.11.2 Changes Introduced in TCP/IP Function Level 320

- The **#CP EXTERNAL** command can no longer be used to terminate RouteD server. The command to stop RouteD is **#CP SMSG * SHUTDOWN**.

5.2.4.12 Remote Execution Services

5.2.4.12.1 Changes Introduced in TCP/IP Level 440

- The **REXEC** server has been updated to allow users with LOGONBY authority for a given *base* virtual machine to exercise that same authority when z/VM commands are remotely executed. This is accomplished through use of the CP Diagnose X'88' command within the REXEC server, which allows access to *base* user ID resources without requiring the password for that *base* user ID to be supplied.

This kind of access is achieved by qualifying a remote login user ID with a new “/BY/*byuser_id*” parameter, when that user ID is specified using the **-I** operand of the **rexec** command. In addition, the

system directory entry for the REXEC server must include an `OPTION DIAG88` statement, to allow use of the Diagnose X'88' command.

5.2.4.13 SMTP Server

5.2.4.13.1 Changes Introduced in TCP/IP Level 440

- Support for a new **VERIFYBATCHSMTPSENDER** configuration statement is added. When this statement is used, SMTP will reject batch mail that contains a MAIL FROM: address that differs from available RSCS information. Specific users can be exempted from this verification through the use of additional VERIFYBATCHSMTPSENDER operands.

5.2.4.13.2 Changes Introduced in TCP/IP Level 420

- Support for new **FILESPERCONN** and **MAXCONNPERSITE** statements has been added. These statements allow more control over the establishment of connections with remote SMTP servers, and may aid with adjusting mail delivery throughput.
- An **SMSG REFRESH** command can now be used by authorized users to dynamically update SMTP security or nickname table information, depending on the configuration of the SMTP server.

5.2.4.13.3 Changes Introduced in TCP/IP Level 3A0

- Timing values for the **RETRYAGE** and **WARNINGAGE** statements can now be specified in hours or minutes (in addition to a number of *days*), through the use of additional **H** or **M** statement operands. Existing defaults (specified in days, for which a **D** statement operand can now be specified) remain unchanged.

5.2.4.13.4 Changes Introduced in TCP/IP Function Level 320

- Support for the SMTP **EHLO** command has been added, as has support for the Message Size Declaration and 8-bit MIME transport service extensions. With this support, SMTP now accepts and handles the SIZE and BODY parameters on MAIL FROM: commands.

5.2.4.13.5 Changes Introduced in TCP/IP Function Level 310

- The **DEBUG** configuration file statement is no longer supported. This statement has been replaced by the **TRACE** statement which, when specified with the DEBUG parameter, provides identical function as the DEBUG statement, except that output goes to only the console; there is no debug file support. Refer to the chapter titled "Configuring the SMTP Server" in *z/VM: TCP/IP Level 440 Planning and Customization* for more information about the TRACE statement and additional parameters that can be specified.
- The default for the **WARNINGAGE** configuration file statement has been reduced from 3 days to 1 day.
- Due to the introduction of new and changed trace options, the **TRACE SMSG** command now requires additional options to be specified. In TCP/IP for VM releases prior to TCP/IP Function Level 310, the **TRACE SMSG** command was used to trace host name resolution via name servers. This SMSG command has been replaced with the **TRACE RESOLVER SMSG** command. Similar results can be

achieved by specifying the TRACE RESOLVER statement in the SMTP configuration file. Refer to the chapter titled “Configuring the SMTP Server” in *z/VM: TCP/IP Level 440 Planning and Customization* for more information about configuration file changes, and to the *z/VM: TCP/IP Level 440 User's Guide* for SMTP SMSG command interface changes.

- The SMTP DATA file is no longer needed. The **ATSIGN** statement previously supported using this file has been incorporated within the TCPIP DATA file.
- The sample SMTP configuration file (SMTP SCONFIG) now specifies “NETDATA” as the default for both the **LOCALFORMAT** and **RSCSFORMAT** statements, to reflect the operational default value associated with these statements.
- Host names for mail items can now be re-resolved (when required) by using the **REPROCESS** SMSG command. Refer to the chapter titled “Configuring the SMTP Server” in *z/VM: TCP/IP Level 440 Planning and Customization* for more information. The formerly documented SMTP-EXP EXEC is no longer needed for this purpose and **should not be used**.
- SMTP work files (NOTE and ADDRBLK files) have new formats and names; the file types for these files have been changed to NOTEFILE and ADDRFILE, respectively. When migrating from IBM TCP/IP for VM Version 2 Release 4, any NOTE or ADDRBLK files present on the SMTP server A-disk are converted to the new format and renamed; such converted files cannot be processed by previous versions of TCP/IP for VM.

5.2.4.14 SSL Server

5.2.4.14.1 Changes Introduced in TCP/IP Level 440

- Linux-based components of the SSL server implementation are now provided using RPM-format files, which are maintained on a newly introduced TCP/IP service build disk. When the SSL server is configured for use, the appropriate RPM package file must be retrieved from this disk and then installed on the intended Linux guest by using the Red Hat Package Manager (RPM).

The DASD requirements for the SSL Server have also been modified, to allow for more flexibility in how the required Linux guest services are provided. As a result of these changes, SSL-specific binary system files are no longer required (or provided) with TCP/IP for z/VM.

- The syntax for the **SSLADMIN SELF** command has been modified to be more consistent with that of the SSLADMIN STORE command.

5.2.4.15 TCP/IP (Stack) Server

5.2.4.15.1 Changes Introduced in TCP/IP Level 440

- Be certain the following change is noted and properly addressed for your environment:

Action Required

- **TCP/IP Port Restriction Defaults Have Changed**
- **Multiple TCP/IP applications may be affected and some TCP/IP applications may no longer function unless you take action.**

The security of the z/VM TCP/IP stack has been improved by making the **RESTRICTLOWPORTS** operand of the **ASSORTEDPARMS** statement active *by default*. Thus, **all TCP/IP applications that listen on “well-known” ports (ports 1 through 1023)** must be given permission to do so. Such permission can be granted by customizing the TCP/IP server configuration file (PROFILE TCPIP, or its equivalent) in one of three ways:

1. Use the **PORT** statement to reserve the specific port (or ports) required by each application (virtual machine) used on your system. **This is the preferred method**. Note that with TCP/IP Level 440, ports can be reserved within a specific range, in addition to being reserved on an individual basis.
2. Modify the **OBEY** statement such that affected application virtual machines are included in the TCP/IP obey list.
3. Include the **FREELOWPORTS** operand as part of an **ASSORTEDPARMS** statement. Note that *this method removes the default protection for all well-known ports*

Note: When the **RESTRICTLOWPORTS** default is in effect and appropriate port authorizations have not been provided, applications that rely upon well-known ports (for example, VM-based web servers or remote printing functions such as **lpr**) are likely to report “Unable to open port(s)” or “Permission denied” conditions.

- For **DEVICE** statements that correspond to *real* interface devices, a **CPU** operand can now be specified to designate a particular virtual processor for running the device drivers associated with such devices. Note that to exploit this capability, the stack must be configured as a virtual multiprocessor (Virtual MP).
- The *send_limit* and *receive_limit* defaults for the **DATABUFFERLIMITS** statement have been increased from **5** to **8**.
- Support for a new **SOMAXCONN** statement is introduced. This statement provides control over the maximum number of pending connection requests that are queued for a listening socket. The default maximum is **10**. Note that using a different SOMAXCONN value may require corresponding changes to the SOCKET.H file, to allow for effective use of the specified maximum by C socket programs.
- Support for a new **LINK** statement operand, **NOFORWARD** (and its synonym, **NOFWD**) is introduced. This operand specifies that packets received on the designated link are not to be forwarded to another host, and that packets transmitted on this link must originate from the local host. In other words, when the **NOFORWARD** operand is specified for a link, traffic carried on that link will not be intermingled with traffic on other links.
- By default, the TCP/IP stack will produce **DTCREQ076I** and **DTCREQ077I** console messages to alert TCP/IP administrators of conditions in which a (Pascal-based) client-stack mismatch is detected. In the event the volume of such messages is too great, the **NOLEVELWARNING** operand of the **ASSORTEDPARMS** statement can be used to suppress these messages.
- The **PORTNAME** operand for **OSD** and **HiperSockets DEVICE** statements is now optional. However, for some OSA Express adapter levels (whether real or virtual), a PORTNAME operand and value must still be specified. When such an adapter is in use and the PORTNAME operand is omitted, error message DTCOSD310E will be displayed during device initialization.

- Virtual Local Area Network (**VLAN**) identifiers can now be specified on **QDIOETHERNET** and **QDIOIP LINK** statements, as well as with the **IFCONFIG** command.
- The TCP/IP stack can now act as a controller for a z/VM Virtual Switch. The **VSWITCH CONTROLLER** statement, along with the **IUCV *VSWITCH** system directory statement, determines whether a given stack can act as such a controller.
- The **NETSTAT DEVLINKS** command now reports data traffic information for the majority of devices that are supported by TCP/IP for z/VM. Traffic information is provided by newly introduced **BytesIn** and **BytesOut** fields that are included as part of the NETSTAT information produced for a given device.
- The **NETSTAT** command has been modified to produce nonzero return codes to aid in distinguishing command processing errors when they arise. Thus, local applications that utilize NETSTAT commands may require modification to interrogate and account for return codes other than zero. Details about **NETSTAT** return codes and the reasons for them can be found in the *z/VM: TCP/IP Level 440 User's Guide*.

5.2.4.15.2 Changes Introduced in TCP/IP Level 430

- The **NETSTAT** command now supports an **OBEY** option, which can be used to make dynamic changes to the TCP/IP stack server configuration. Any data that is appropriate for use with the OBEYFILE command can be processed using a NETSTAT OBEY command (to the extent that data can be provided via the CMS command line).
- The **IFCONFIG** command introduced with this level of TCP/IP can be used to make dynamic configuration changes to network interfaces for the z/VM TCP/IP stack, or to display the current configuration. Note that network changes made using IFCONFIG are *not permanent*. However, IFCONFIG can produce data that is compatible with the TCP/IP server configuration file, which then can be used for permanent modifications.

5.2.4.15.3 Changes Introduced in TCP/IP Level 420

- TCPIP has been changed to recognize a TCP/IP loopback address of *only* **127.0.0.1**. TCPIP no longer supports an alternative loopback address of 14.0.0.0.

Existing TCPIP DATA files should be reviewed for **NSINTERADDR** statements that currently include a 14.0.0.0 loopback address. All such statements should be modified to instead make use of the conventional 127.0.0.1 address that is now supported/in use.

- The number of **DEVICE** statements that can be specified within the TCP/IP server configuration file is no longer limited to 100 such statements. The number of DEVICE statements that can be supported is now determined by the virtual storage size of the TCPIP virtual machine.
- Proxy ARP support (activated through use of the **PROXYARP** operand of the **ASSORTEDPARMS** statement) can now be used with OSA Direct (OSD) devices, as well as for more traditional point-to-point connections.
- The default for the **SCANINTERVAL** operand of the **INTERNALCLIENTPARMS** statement (used for Telnet server configuration) has been changed from 120 to 60 seconds.

5.2.4.15.4 Changes Introduced in TCP/IP Function Level 320

- The **TIMESTAMP** statement default has been changed from **TIMESTAMP 0** to **TIMESTAMP PREFIX**, which specifies that a time stamp is to preface every trace and console message. This change helps in diagnosing problems and isolating error conditions. Therefore, it is recommended that any existing TCP/IP server configuration files be changed to specify **TIMESTAMP PREFIX** to aid in problem determination.
- The Telnet session connection exit interface has been changed to pass the LU name supplied by a client (if any) as an additional parameter. Existing exits may need to be changed to accommodate this behavior.
- The Telnet printer management exit is called for any printer session, regardless of whether the client LU name and IP address are defined by a **TN3270E** statement in the TCP/IP configuration file. Existing exits may need to be changed to accommodate this behavior.

5.3 DASD Storage and User ID Requirements

Figure 11 on page 32 lists the user IDs and minidisks used to install and service TCP/IP for z/VM.

Important Installation Notes:

1. The user IDs necessary for installing and using TCP/IP for z/VM have been defined as part of the installed z/VM Version 4 Release 4.0 System DDR. Likewise, all required minidisks have been defined. These resources have been listed in Figure 11 so you are aware of the resources that have been allocated on your behalf.

For information about specific user ID directory entry requirements, consult the **4TCPIP40 PLANINFO** file. This file is located on the 4TCPIP40 191 minidisk.

Note — z/VM Automated Service Procedure

If you modify any of the IBM-supplied user IDs, minidisk addresses, or SFS directory names that are associated with TCP/IP for z/VM and you plan on using the z/VM automated service procedure (the **SERVICE** and **PUT2PROD** commands) to service your z/VM system, then you must create a PPF override for the **SERVP2P \$PPF** file.

You must also use the **VMFUPDAT** command to update the VM SYSSUF software inventory file, so that your PPF override of **SERVP2P PPF** is used for automated service processing. For more information about PPF file overrides, see the *z/VM: VMSES/E Introduction and Reference*

2. The **4TCPIP40** user ID is the IBM-supplied user ID for installing and servicing TCP/IP for z/VM. If you choose to use a different user ID or you elect to use different minidisks and/or SFS directories for TCP/IP for z/VM maintenance purposes, review the information presented in Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93 prior to making any changes.
3. The minidisks that are associated with the **4TCPIP40**, **TCPMaint**, and **TCPIP** user IDs (or your chosen equivalents) **must** be maintained in order to provide TCP/IP services within your environment. The remaining user IDs listed in Figure 11 are associated with servers and clients that provide optional TCP/IP for z/VM services. If you choose to not use a particular optional service, you need not maintain the user IDs and production minidisks associated with that service. However, be sure to review the information presented in Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93 prior to making any changes.
4. If you choose to use user IDs for TCP/IP server virtual machines that differ from the IBM-supplied user IDs shown in Figure 11, review the section titled “Implications of Assigning Different Server Virtual Machine Names” in Chapter 1 of *z/VM: TCP/IP Level 440 Planning and Customization*. Also, review the information presented in Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93.
5. Note the following, with regard to the user ID and minidisk information provided in Figure 11:

Specific Minidisk Requirements

Certain minidisks **must** be defined for the TCP/IP server machines you choose to use, as well as for maintaining TCP/IP for z/VM in your environment. Such minidisks **cannot** be replaced with an equivalent SFS directory.

Minidisks to which this requirement applies are listed in Figure 11 with **boldface** virtual device numbers. In addition, no default SFS directory names or SFS 4K block values are provided for these minidisks.

6. **All 4TCPIP40 *test build* minidisks must** be maintained. If the 4TCPIP40 minidisks for optional services are not maintained, problems will be encountered during installation and service.

If you choose to eliminate any of the resources which correspond to TCP/IP services that are not required for your installation, review the considerations presented in Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93 prior to making any changes.
7. Additional storage may need to be allocated for a given user ID or server minidisk, depending on your environment. Some examples of minidisks that may need to be increased, and possible reasons for so doing, are listed in Figure 9. Note that certain minidisks (not cited here) may also need to be increased to accommodate the logging of tracing or other activities.

Figure 9. Alternative Minidisk Storage Requirements

User ID / Minidisk	Rationale for Storage Revision
SMTP 191	Allow for SMTP processing of a high volume of e-mail
VMNFS 191	Provide support for a large number of NFS clients
DHCPD 191	Provide support a large number of DHCP clients
LPSERVE 191	Allow for LPD processing of sizeable print jobs
SSLSERV 201	Facilitate installation of a Linux kernel and file system
4TCPIP40 2D2	Facilitate maintenance of multiple service levels of (binary) RPM files used by the SSL server

8. The storage requirements for various TCP/IP minidisks may be revised over time to account for TCP/IP for z/VM content changes. In some cases, this may require the size of existing minidisks to be increased.

When applicable, storage requirement changes for specific minidisks will be identified in Figure 11, in updated levels of this document. Such changes will be noted through the use of revision characters (usually a vertical bar — “|” in the left margin of a page).

For other minidisks, storage requirement changes will need to be assessed locally, for your specific environment. For example, the capacity of the **DELTA** minidisk (**4TCPIP40 2D2**, by default), periodically may need to be increased, based on the specific preventive and corrective service applied to your system.

9. If you choose to provide Network Database services, you may find the need to define multiple virtual machines, named NDBSRV01, NDBSRV02, etc. Each NDBSRV n virtual machine you create should be defined similar to NDBSRV01, which has been defined as part of the installed z/VM Version 4 Release 4.0 System DDR.
10. If you choose to provide remote execution services through use of the rexec daemon (REXECD), you may find the need to define multiple agent virtual machines, named RXAGENT1, RXAGENT2, etc. Each RXAGENT n virtual machine you create should be defined similar to RXAGENT1, which has been defined as part of the installed z/VM Version 4 Release 4.0 System DDR. However, note that the RXAGENT n virtual machines do not “own” any minidisks.
11. To use the Secure Socket Layer (SSL) server, a suitably configured Linux kernel and file system must be installed on your z/VM system. Information about Linux requirements and preparing Linux for use with the SSL server is available at the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

12. Source files are supplied in packed format. If you intend to unpack source files after installation, ensure sufficient space is allocated for the unpacked files. Alternative storage requirements for storing unpacked files on the TCP/IP **SOURCE** minidisk (**4TCPIP40 2B3**, by default) are listed in Figure 10:

Figure 10. 4TCPIP40 2B3 Minidisk Storage Requirements — Unpacked Source Files

Type of Storage	Alternate Storage Requirement
3390 DASD	80 cylinders
3380 DASD	96 cylinders
9345 DASD	96 cylinders
FBA Device	114080 FB-512 blocks
SFS Directory	14260 SFS 4K blocks

13. For information about copying client code to the Product Code minidisk, see Appendix H, “Copying TCP/IP for z/VM Client Code to the Y-Disk” on page 114.

5.3.1 DASD Requirements for TCP/IP for z/VM

Figure 11 (Page 1 of 6). DASD Storage Requirements for Target Minidisks - TCP/IP for z/VM

Minidisk owner (User ID)	Default Device Number	Storage in Cylinders		FB-512 Blocks	SFS 4K Blocks	Usage
		DASD	CYLS			Default SFS Directory Name
4TCP/IP40	191	3390 3380 9345	20 24 24	28800	3600	4TCP/IP40 user ID 191 minidisk VMSYS:4TCP/IP40
4TCP/IP40	2B2	3390 3380 9345	86 103 103	123200	15400	Contains all base code shipped with TCP/IP for z/VM VMSYS:4TCP/IP40.TCPIP.OBJECT
4TCP/IP40	2B3	3390 3380 9345	55 66 66	78400	9800	Source files disk. (3*) VMSYS:4TCP/IP40.TCPIP.SOURCE
4TCP/IP40	29D	3390 3380 9345	5 5 5	6000	750	Contains TCP/IP CMS Help files VMSYS:4TCP/IP40.TCPIP.HELP
4TCP/IP40	2C4	3390 3380 9345	5 5 5	6000	750	Contains local modifications VMSYS:4TCP/IP40.TCPIP.LOCAL
4TCP/IP40	2D2	3390 3380 9345	117 140 140	167200	20900	Contains serviced files (3*) VMSYS:4TCP/IP40.TCPIP.DELTA
4TCP/IP40	2A6	3390 3380 9345	5 5 5	6000	750	Contains AUX files and software inventory tables that represent the test service level of TCP/IP for z/VM VMSYS:4TCP/IP40.TCPIP.APPLYALT

Notes:

1. Cylinder values defined in this table are based on a 4K block size. FB-512 block and SFS values are derived from the 3380 cylinder values in this table. FBA minidisk sizes are shown in 512-byte blocks; these minidisks should be CMS formatted at 1K size.
2. For installation to SFS directories, a total of **58100** 4K blocks are required.
3. Additional storage may need to be allocated for some minidisks, depending on your environment. For more information, see the accompanying notes on page 28.
4. See Appendix H, "Copying TCP/IP for z/VM Client Code to the Y-Disk" on page 114 for information about copying client code to the Product Code minidisk

Figure 11 (Page 2 of 6). DASD Storage Requirements for Target Minidisks - TCP/IP for z/VM

VMKERB	191	3390 3380 9345	6 7 7	8400	_____	VMKERB user ID 191 minidisk

Notes:

1. Cylinder values defined in this table are based on a 4K block size. FB-512 block and SFS values are derived from the 3380 cylinder values in this table. FBA minidisk sizes are shown in 512-byte blocks; these minidisks should be CMS formatted at 1K size.
2. For installation to SFS directories, a total of **58100** 4K blocks are required.
3. Additional storage may need to be allocated for some minidisks, depending on your environment. For more information, see the accompanying notes on page 28.
4. See Appendix H, "Copying TCP/IP for z/VM Client Code to the Y-Disk" on page 114 for information about copying client code to the Product Code minidisk

Figure 11 (Page 6 of 6). DASD Storage Requirements for Target Minidisks - TCP/IP for z/VM

Minidisk owner (User ID)	Default Device Number	Storage in Cylinders		FB-512 Blocks	SFS 4K Blocks	Usage
		DASD	CYLS			Default SFS Directory Name
VMNFS	191	3390 3380 9345	9 10 10	12000	_____	VMNFS user ID 191 minidisk (3*)
X25IPI	191	3390 3380 9345	2 2 2	2400	_____	X25IPI user ID 191 minidisk

Notes:

1. Cylinder values defined in this table are based on a 4K block size. FB-512 block and SFS values are derived from the 3380 cylinder values in this table. FBA minidisk sizes are shown in 512-byte blocks; these minidisks should be CMS formatted at 1K size.
2. For installation to SFS directories, a total of **58100** 4K blocks are required.
3. Additional storage may need to be allocated for some minidisks, depending on your environment. For more information, see the accompanying notes on page 28.
4. See Appendix H, "Copying TCP/IP for z/VM Client Code to the Y-Disk" on page 114 for information about copying client code to the Product Code minidisk

6.0 Installation Instructions

This section describes the method by which TCP/IP for z/VM is installed and provides step-by-step procedures to complete the installation process.

The procedures that follow are presented in two-column format, where the steps to be performed are identified using numbered, **boldface** headings. Any sub-steps that correspond to a given procedure are presented on the right side of each page and are ordered using bold numerals, while the commands associated with these steps are presented on the left side of a page. Pertinent command information may exist to the right of a given command.

Each step of these installation instructions must be followed. Do not skip any step unless directed otherwise.

Throughout these instructions, the use of IBM-supplied default minidisk device numbers and user IDs is assumed. If different user IDs, device numbers, or SFS directories are used to install TCP/IP for z/VM in your environment, adapt these instructions as needed.

Note!

Any sample console output presented throughout these instructions is based on a z/VM Version 4 Release 4.0 system; this output reflects an installation environment in which default values (PPF and component names, user IDs, and minidisks) are in use.

6.1 TCP/IP for z/VM Installation Process Overview

A brief description of the steps necessary to complete the installation of TCP/IP for z/VM follows:

- **Review the Default Installation** — Various resources have been defined and allocated for TCP/IP for z/VM, as part of the installed z/VM Version 4 Release 4.0 System DDR. This default environment should be reviewed and, if necessary, modified for your installation.
- **Review TCP/IP for z/VM Content and Changes** — Review the topics presented in 5.2.4, “Migration Considerations” on page 15, so you are aware of changes that may affect your customization and use of TCP/IP Level 440.
- **Configure TCP/IP for z/VM** — The configuration files associated with the various TCP/IP services must be customized to effectively use TCP/IP for z/VM.

For a complete description of all VMSES/E installation commands, operands and options, refer to:

- *z/VM: VMSES/E Introduction and Reference (GC24-5994)*

6.2 Installing TCP/IP for z/VM

Note — All z/VM Customers

The material presented in the next few sections is provided mostly for informational and references purposes. To complete the installation of TCP/IP for z/VM, continue with the instructions in section 6.2.2.1, “Configure TCP/IP for z/VM for Your Installation” on page 43.

6.2.1 Review the TCP/IP for z/VM Default Installation Environment

Because TCP/IP for z/VM has been installed as part of the z/VM Version 4 Release 4.0 system DDR, several installation steps have already been performed on your behalf. Among these are the:

- addition of TCP/IP-specific user ID entries and PROFILES to the z/VM Version 4 Release 4.0 system directory
- creation of a simplified PROFILE EXEC for the 4TCPIP40 user ID
- allocation of TCP/IP-required minidisks
- loading of TCP/IP for z/VM product files (run-time and sample configuration files) to test build *and* production minidisks, using VMSES/E commands.

6.2.1.1 PPF Override and Other Modification Considerations

The file name (or, *ppfname*) of IBM-supplied Product Parameter File (PPF) for TCP/IP for z/VM is **4TCPIP40**. This file has been installed (and used) as part of the z/VM Version 4 Release 4.0 system DDR installation. The **4TCPIP40** *ppfname* is also assumed and referenced throughout section 7.0, “Service Instructions.”

If you create your own TCP/IP for z/VM PPF override file, use the *ppfname* of your override file (instead of 4TCPIP40) throughout any procedures that require this file to be identified, unless noted otherwise.

Note — z/VM Automated Service Procedure

If you modify any of the IBM-supplied user IDs, minidisk addresses, or SFS directory names that are associated with TCP/IP for z/VM and you plan on using the z/VM automated service procedure (the **SERVICE** and **PUT2PROD** commands) to service your z/VM system, then you must create a PPF override for the **SERVP2P \$PPF** file.

You must also use the **VMFUPDAT** command to update the VM SYSSUF software inventory file, so that your PPF override of SERVP2P PPF is used for automated service processing. For more information about PPF file overrides, see the *z/VM: VMSES/E Introduction and Reference*

As *z/VM: TCP/IP Level 440 Planning and Customization* is reviewed and used to configure TCP/IP, you may also identify TCP/IP services that are not required for your installation. If you choose to eliminate the resources that correspond to these services, review the considerations presented in Appendix C, “Modifying the TCP/IP for z/VM Default Installation” on page 93 prior to making any changes.

6.2.1.2 TCP/IP for z/VM Directory PROFILES and User IDs

Two system directory PROFILE entries (PROFILE TCPCMSU and PROFILE TPCGCSU) have been added to the z/VM Version 4 Release 4.0 system directory for TCP/IP for z/VM; these entries are shown in Figure 12 on page 40. Each directory entry supplied for a TCP/IP for z/VM service virtual machine includes one of these profiles.

Figure 12. TCP/IP for z/VM System Directory Profiles

<pre>PROFILE TCPCMSU IPL CMS MACHINE XA SPOOL 00C 2540 READER * SPOOL 00D 2540 PUNCH A SPOOL 00E 1403 A CONSOLE 009 3215 T LINK MAINT 190 190 RR LINK MAINT 19D 19D RR LINK MAINT 19E 19E RR LINK MAINT 0401 0401 RR LINK MAINT 0402 0402 RR LINK MAINT 0405 0405 RR</pre>	<pre>PROFILE TPCGCSU IPL GCSXA PARM AUTOLOG MACHINE XA NAMESAVE GCS SPOOL 00C 2540 READER * SPOOL 00D 2540 PUNCH A SPOOL 00E 1403 A CONSOLE 009 3215 T LINK MAINT 190 190 RR LINK MAINT 19D 19D RR LINK MAINT 19E 19E RR LINK MAINT 0401 0401 RR LINK MAINT 0402 0402 RR LINK MAINT 0405 0405 RR</pre>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Notes:

1. Links to the MAINT 401, 402 and 405 minidisks are established to facilitate the use of CMS Kanji, German and Upper Case American English HELP files, for those environments in which these may be required.
2. The NAMESAVE GCS statement can be removed from PROFILE TPCGCSU if the GCS saved segment is not restricted.

The user IDs that have been defined for TCP/IP for z/VM are listed in Figure 13 on page 41.

Note: When installation of the z/VM Version 4 Release 4.0 System DDR has been completed, the login password for a given TCP/IP user ID is identical to that same user ID. If you have not already done so, change these passwords to valid passwords, in accordance with your security guidelines.

Additional User ID Notes:

1. For information about specific user ID directory entry requirements, consult the **4TCPIP40 PLANINFO** file. This file is located on the 4TCPIP40 191 minidisk.
2. The directory entries supplied for each TCP/IP for z/VM service virtual machine now include LINK statements for the 4TCPIP40 491 and 492 minidisks. These minidisk links have been added to better facilitate the testing of newly applied service.

- The directory entry for the TCPIP virtual machine includes the statement: `SHARE RELATIVE 3000`

For most installations, the relative CPU share allocation of 3000 should be suitable. However, you are free to change this value to conform to local guidelines established for defining server and guest virtual machine share settings.

- If you create additional `RXAGENT n` machines, duplicate the `RXAGENT1` directory entry for each server you add.
- If you create additional `NDBSRV nn` machines, duplicate the `NDBSRV01` directory entry for each server you add, and include an appropriate `LINK` statement in the `4TCPIP40` directory entry for each new server 191 minidisk that is created.

Formatting Reminder

Any additional minidisks you create must be formatted before you continue with the installation of TCP/IP for z/VM.

Figure 13 (Page 1 of 2). Default User IDs - TCP/IP for z/VM

TCP/IP User ID	Associated TCP/IP Function
4TCPIP40	Manages the TCP/IP system (component code and service updates).
TCPMAINT	TCP/IP system administration and configuration.
ADMSERV	Runs the Kerberos database remote administration server.
BOOTPD	Responds to client requests for boot information using data defined in a BOOTP machine file.
DHCPD	Responds to client requests for boot information using data defined in a DHCPD machine file.
FTPSERVE	Implements the File Transfer Protocol (FTP) daemon, which controls access to files on the local host.
IMAP	Implements the Internet Message Access Protocol (IMAP) daemon, which allows a client to access and manipulate electronic mail messages on a server.
IMAPAUTH	Performs IMAP user authentication, when the IMAP server has been configured to make use of the IMAP Authentication Exit.
LPSERVE	Implements the Line Printer Daemon (LPD), which handles client requests to print a file.
MROUTE	Implements the Multiple Protocol ROUTE (MROUTE) server, which uses OSPF and/or RIP protocols to manage network routing information.
NAMESRV	Implements the Domain Name System (DNS) server.
NDBPMGR	Provides Network Database (NDB) Port Manager support, and is used in conjunction with the NDBSRV01 server.
NDBSRV01 (1*)	Provides Network Database (NDB) System support, in conjunction with the NDB Port Manager (NDBPMGR) server.

Notes:

- Additional changes may need to be made for some user IDs, depending on your environment. For more information, see the accompanying notes on page 40.

Figure 13 (Page 2 of 2). Default User IDs - TCP/IP for z/VM

TCP/IP User ID	Associated TCP/IP Function
PORTMAP	Runs the Portmapper function for RPC systems that support the Network File System protocol.
REXECD	Provides remote execution services for TCP/IP hosts that support the REXEC client.
ROUTED	Implements the RouteD server, which manages IP route table entries.
RXAGENT1 (1*)	Agent virtual machine used by REXECD to process anonymous rexec client requests.
SMTP	Implements the Simple Mail Transfer Protocol (SMTP) server, which provides TCP/IP electronic mail support.
SNALNKA	Provides SNA LU 0 connections between multiple hosts.
SNMPD	Virtual machine for the SNMP Agent.
SNMPQE	Virtual machine for the SNMP Query Engine.
SSLSERV	Provides Secure Sockets Layer (SSL) protocol support for TCP/IP servers.
TCPIP (1*)	Primary virtual machine that provides TCP/IP and Telnet services.
TFTPD	Transfers files between the Byte File System (BFS) and TFTP clients.
UFTD	Implements the Unsolicited File Transfer (UFT) server.
VMKERB	Runs the Kerberos authentication server.
VMNFS	Implements the Network File System (NFS) server.
X25IPI	Provides an interface which allows the TCPIP virtual machine to communicate with hosts that use the X.25 protocol.

Notes:

1. Additional changes may need to be made for some user IDs, depending on your environment. For more information, see the accompanying notes on page 40.

6.2.2 Move TCP/IP for z/VM to SFS Directories (Optional)

By default, TCP/IP for z/VM is installed to minidisks, as part of the z/VM Version 4 Release 4.0 System DDR. However, you can move TCP/IP for z/VM service minidisks to Shared File System (SFS) directories. See Appendix G, “Moving TCP/IP for z/VM to SFS Directories” on page 109 for instructions on how this can be done.

6.2.2.1 Configure TCP/IP for z/VM for Your Installation

TCP/IP for z/VM has been installed with copies of *sample* configuration files that are used by various TCP/IP servers and clients. Before any TCP/IP services are used, these configuration files must be customized for your environment.

See *z/VM: TCP/IP Level 440 Planning and Customization (SC24-6019)* for detailed information about the various TCP/IP services that can be configured for your installation, and for details about the configuration files that are associated with each service. For reference, the sample files supplied by IBM are summarized in Figure 16 on page 47.

IPWIZARD Considerations

If the IPWIZARD command has been used to create an initial TCP/IP configuration, the following files have been customized:

- PROFILE TCPIP
- SYSTEM DTCPARMS
- TCPIP DATA

These files enable basic network connectivity for your z/VM system and their content is based on information supplied via the IPWIZARD panels. If you intend to provide more comprehensive TCP/IP services for your installation, the previously listed files will require further customization, as will other TCP/IP configuration files.

If the IPWIZARD command has **not** been used, the PROFILE TCPIP and TCPIP DATA files are present, but contain only *sample* data; the SYSTEM DTCPARMS file does not yet exist.

6.2.2.2 Initialize TCP/IP Services

Once TCP/IP for z/VM has been (fully) configured for your environment, the appropriate TCP/IP servers must be initialized. For more information, see the section that discusses “Starting and Stopping TCP/IP Servers” in the chapter titled “General TCP/IP Server Configuration,” of *z/VM: TCP/IP Level 440 Planning and Customization*.

6.2.2.3 Copy TCP/IP Client Code to the z/VM Product Code Disk (Optional)

After TCP/IP for z/VM has been configured for your environment, you may want to consider copying TCP/IP client code (or a subset of this) to the z/VM Product Code minidisk. See Appendix H, “Copying TCP/IP for z/VM Client Code to the Y-Disk” on page 114 for additional information and instructions concerning this process.

6.2.2.4 TCP/IP for z/VM Product and Sample Configuration Files

Figure 14 lists the name and location of IBM-supplied TCP/IP for z/VM product files that must reside on individual server virtual machine (SVM) minidisks. The names and location of these files, as placed into production by the VMSES/E **PUT2PROD** command, are listed as well.

Note: Because of their use and composition, the files listed in Figure 14 are *not* processed when TCP/IP for z/VM *service* is installed. Should the need arise (such as for unique or extenuating circumstances), these files can be processed using the **TCP2PROD** command and the **TCPSVM** section of the 4TCPIP40 CATALOG file.

Figure 14 (Page 1 of 2). TCP/IP for z/VM Production Run-Time Files (SVM Specific)

4TCPIP40 Source Minidisk	4TCPIP40 Link Device Number	Source File Name / Type	Production File Name / Type	Target Minidisk (or Usage)
491	262	TCPROFIL EXEC	PROFILE EXEC	TCPIP 191
491	263	TCPROFIL EXEC	PROFILE EXEC	ADMSERV 191
491	264	TCPROFIL EXEC	PROFILE EXEC	BOOTPD 191

Notes:

1. The TCPROFIL GCS profiles are not interchangeable with the TCPROFIL EXEC used for other TCP/IP servers.
2. TCPROFIL EXEC should be copied to the 191 disk of any additional NDBSRV nn servers that are installed.

<i>Figure 14 (Page 2 of 2). TCP/IP for z/VM Production Run-Time Files (SVM Specific)</i>				
4TCPIP40 Source Minidisk	4TCPIP40 Link Device Number	Source File Name / Type	Production File Name / Type	Target Minidisk (or Usage)
491	265	TCPROFIL EXEC	PROFILE EXEC	DHCPD 191
491	266	TCPROFIL EXEC	PROFILE EXEC	FTPSERVE 191
491	267	TCPROFIL EXEC	PROFILE EXEC	LPSERVE 191
491	268	TCPROFIL EXEC	PROFILE EXEC	MROUTE 191
491	269	TCPROFIL EXEC	PROFILE EXEC	NAMESRV 191
491	26A	TCPROFIL EXEC	PROFILE EXEC	NDBPMGR 191
491	26B	TCPROFIL EXEC (2 ^o)	PROFILE EXEC	NDBSRV01 191
491	26C	TCPROFIL EXEC	PROFILE EXEC	PORTMAP 191
491	26D	TCPROFIL EXEC	PROFILE EXEC	REXECD 191
491	26E	TCPROFIL EXEC	PROFILE EXEC	ROUTED 191
491	26F	TCPROFIL EXEC	PROFILE EXEC	SMTP 191
491	270	TCPROFIL GCS (1 ^o)	PROFILE GCS	SNALNKA 191
491	271	TCPROFIL EXEC	PROFILE EXEC	SNMPD 191
491	272	TCPROFIL EXEC	PROFILE EXEC	SNMPQE 191
491	273	TCPROFIL EXEC	PROFILE EXEC	SSLSERV 191
491	279	TCPROFIL EXEC	PROFILE EXEC	TFTPD 191
491	27A	TCPROFIL EXEC	PROFILE EXEC	UFTD 191
491	27B	TCPROFIL EXEC	PROFILE EXEC	VMKORB 191
491	27C	TCPROFIL EXEC	PROFILE EXEC	VMNFS 191
491	27D	TCPROFIL GCS (1 ^o)	PROFILE GCS	X25IPI 191
491	27E	TCPROFIL EXEC	PROFILE EXEC	IMAP 191
491	27F	TCPROFIL EXEC	PROFILE EXEC	IMAPAUTH 191

Notes:

1. The TCPROFIL GCS profiles are not interchangeable with the TCPROFIL EXEC used for other TCP/IP servers.
2. TCPROFIL EXEC should be copied to the 191 disk of any additional NDBSRVnn servers that are installed.

Figure 15 on page 46 lists the name and location of TCP/IP for z/VM product run-time files provided by IBM, and the names and location of these files as placed into production by the VMSES/E **PUT2PROD** command.

Note: The *target* minidisk link device numbers listed in this table correspond to LINK statement defaults; these defaults are defined for the 4TCPIP40 user ID in the system (CP) directory entry that is supplied as part of the z/VM Version 4 Release 4.0 System DDR.

<i>Figure 15. TCP/IP for z/VM Production Run-Time Files</i>				
4TCPIP40 Source Minidisk	4TCPIP40 Link Device Number	Source File Name / Type	Production File Name / Type	Target Minidisk (or Usage)
491	591	— All Files —	(no change)	_____
492	592	— All Files —	(no change)	_____
492	493C	VMRPC TXTLIB	VMRPC TXTLIB	DMSVSMAS
492	193C	VMRPC TXTLIB	VMRPC TXTLIB	DMSVSMAS

Figure 16 on page 47 lists the name and location of TCP/IP for z/VM sample configuration files provided by IBM (and the default names and location for their customized counterparts) as placed into production by the VMSES/E **PUT2PROD** command. The server or user groups for which a given file is required (or may be used) are identified as well.

Note: Unless otherwise noted, the **Sample** and **Configured** disks cited in this table are minidisks owned by the TCPMAINT user ID.

Figure 16 (Page 1 of 2). TCP/IP for z/VM Sample/Production Configuration Files

Notes:

1. The ADMSECV 191 minidisk.
2. TCPIP DATA is used by **all** TCP/IP servers and client programs.
3. KRB CONF is used by client applications that utilize Kerberos authentication servers.

TCP/IP for z/VM is now installed and built on your system.

7.0 Service Instructions

Note — z/VM Automated Service Procedure

The z/VM automated service procedure (use of the z/VM **SERVICE** and **PUT2PROD** commands) is the **preferred** method for applying service to TCP/IP for z/VM.

If you have chosen to use the automated service procedure for applying (RSU) and CORrective service to your z/VM Version 4 Release 4.0 system, use the service instructions documented in *z/VM: Guide for Automated Installation and Service* for applying service to TCP/IP for z/VM, instead of those presented here.

This section describes the method by which TCP/IP for z/VM is serviced; it provides step-by-step procedures to install corrective (COR) and preventive service for TCP/IP for z/VM, using VMSES/E. Preventive service for TCP/IP for z/VM is delivered via a Recommended Service Upgrade (RSU) tape.

To become more familiar with service using VMSES/E, read the introductory chapters in:

- *z/VM: VMSES/E Introduction and Reference* (GC24-5994)

This publication also contains command syntax for the VMSES/E commands cited throughout these instructions.

Each step of these service instructions must be followed. Do not skip any step unless directed otherwise.

Throughout these instructions, the use of IBM-supplied default minidisk device numbers and user IDs is assumed. If different user IDs, device numbers, or SFS directories are used to install TCP/IP for z/VM in your environment, adapt these instructions as needed.

Note!

Any sample console output presented throughout these instructions is based on a z/VM Version 4 Release 4.0 system; this output reflects an installation environment in which default values (PPF and component names, user IDs, and minidisks) are in use.

7.1 VMSES/E Service Process Overview

A brief description of the steps required to service TCP/IP for z/VM, using VMSES/E, follows:

- **Merge Existing Service** — The VMFMRDSK command is used to clear the alternate apply disk before receiving new service. This allows you to easily remove new service if a serious problem is encountered during its testing or use.

- **Receive New Service** — The VMFREC command is used to receive service from the delivery media and place it on the DELTA disk.
- **Apply the Service** — The VMFAPPLY command is used to update the version vector table (VVT), which identifies the service level of all serviced parts. In addition, AUX files are generated for parts that require them, based on the content of the VVT.
- **Reapply Local Service** (if applicable) — All local service (*user modifications*, or “mods”) must be entered into the software inventory to allow VMSES/E to track these changes and build them into the system. Refer to Chapter 7 of the *z/VM: Service Guide* for this procedure.
- **Build New Levels** — The build task generates the serviced level of an object and places the new object on a test BUILD disk.
- **Place the New Service into Production** — Once all service has been satisfactorily tested, it is placed into production by copying the new service to the production disks. Note that customized files that have been serviced may require additional customization.

7.2 Servicing TCP/IP for z/VM

7.2.1 Important Service Notes

Before you service TCP/IP for z/VM, you should review the information that follows and take appropriate action to ensure that your service environment is correct.

7.2.1.1 PPF Override Considerations

A *ppfname* of **4TCPIP40** is cited throughout these service instructions, which assumes the PPF supplied by IBM for TCP/IP for z/VM is in use. If you have created your own TCP/IP for z/VM PPF override file, use the *ppfname* of your override file (instead of 4TCPIP40) **throughout** this procedure, unless noted otherwise.

7.2.1.2 Language Environment Run-time Library Considerations

If you service TCP/IP for z/VM C components, the Language Environment for z/VM must be available when you build serviced objects using the VMFBLD command. If the Language Environment for z/VM does not reside on a system minidisk automatically accessed by VMSES/E (such as the MAINT 19E minidisk), you need to ensure the appropriate minidisk is available (perhaps through the use of a PPF override).

7.2.1.3 Installing RSU and COR Service — Where to Begin

Quick Index for Service Instructions

Select the service instructions you should use, based on the type of service you are installing:

- TCP/IP for z/VM RSU Service — Begin with 7.2.2, “Preventive (RSU) Service for TCP/IP for z/VM” on page 52
- TCP/IP for z/VM COR Service — Begin with 7.2.3, “Corrective (COR) Service for TCP/IP for z/VM” on page 61

7.2.2 Preventive (RSU) Service for TCP/IP for z/VM

Preventive service is available periodically on the Recommended Service Upgrade (RSU) tape. Each RSU is cumulative and contains selected, important PTFs. The service on the RSU is in pre-applied, pre-built format and includes serviced files, the objects that were rebuilt using these files, and an updated software inventory.

The RSU content allows for installing new service more quickly than an equivalent group of Corrective (COR) PTFs. However, the installation of an RSU requires that you reapply any reach-ahead service that is already installed (service you have applied to your system that is not on the RSU).

RSU tapes are in *install* format; thus, the VMFINS command is used to load an RSU tape.

7.2.2.1 Prepare to Receive Service

Electronic Service (Envelope File)

If you have received the RSU electronically or on CD-ROM, follow the appropriate instructions to retrieve and decompress the envelope file to your A-disk. Decompression is currently done by using the DETERSE module, which produces a decompressed file that has a file name format of RPTF*num* and a file type of SERVLINK. You will need to supply this file name for the VMFINS commands that follow.

1 Log on the TCP/IP for z/VM service user ID, **4TCPIP40**.

The PROFILE EXEC provided for this user ID (as part of the z/VM Version 4 Release 4.0 System DDR) contains ACCESS commands for the required VMSES/E minidisks — the VMSES/E code minidisk (MAINT 5E5, by default) and the VMSES/E Software Inventory minidisk (MAINT 51D, by default).

2 Issue the CMS QUERY DISK command to verify the VMSES/E code and Software Inventory minidisks are correctly linked and accessed.

query disk

Verify the MAINT 5E5 minidisk is accessed as file mode **B**, and is linked **R/O**.

Verify the MAINT 51D minidisk is accessed as file mode **D**, and is linked **R/W**.

Note: If another user has the MAINT 51D minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the 51D disk in read-only (RR) mode, after which you need issue the appropriate LINK and ACCESS commands for the 51D minidisk. Do not continue with these procedures until a R/W link is established to the 51D minidisk.

3 If necessary, establish the appropriate access to the VMSES/E minidisks.

a Establish read access to the VMSES/E code minidisk.

link MAINT 5e5 5e5 rr
access 5e5 b

b Establish write access to the Software Inventory minidisk.

link maint 51d 51d mr
access 51d d

4 Mount the TCP/IP for z/VM RSU tape on an appropriate device and ensure this device has been attached to the **4TCP40** user ID using virtual device number 181.

5 Receive the product documentation (4TCP40 MEMO) to the 51D minidisk, then identify the products and components for which service is included on the RSU tape. The MEMO documentation identifies the amount of storage necessary to receive the service present on the RSU. Use this information to ensure that your service disks or directories have adequate storage for this purpose.

a If receiving the RSU from **tape**, issue:

vmfins install info (nomemo *nomemo* will load but not print the memo.

b If receiving the RSU from an **envelope** file, issue:

vmfins install info (nomemo env rptfnum *nomemo* will load but not print the memo.

6 Clear the alternate APPLY disk to ensure that a clean minidisk exists for receipt of the new service.

vmfmrisk 4tcp40 {tcpip | tcpipsfs} apply (setup

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command copies the alternate APPLY disk to the production APPLY disk and then clears the alternate APPLY disk.

- 7 Review the merge message log (\$VMFMRD \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview mrd

- 8 Invoke the VMFPSU command to obtain additional information about the service contained on the RSU and how it will affect your local modifications. This command creates an output file (*appid* **PSUPLAN**) that you should review. See the *z/VM: Service Guide* for an explanation of this file and its content.

vmfpsu 4tcpip40 {tcpip | tcpipsfs}

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command produces an output file which compares service present on the RSU to the service on your system. The file name is *appid* **PSUPLAN**, where *appid* is as specified in the PPF file.

7.2.2.2 Receive the Service

- 1 Receive the service on the RSU.

Because the RSU contains pre-applied, pre-built service in *install* format, the VMFINS command is used to load:

- new service to the DELTA disk,
- an updated apply service inventory to the APPLY disk, and
- pre-built objects to the appropriate test build disks.

a If receiving the RSU from **tape**, issue:

vmfins install ppf 4tcpip40 {tcpip | tcpipsfs} (nomemo nolink

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

nolink prevents VMFINS from linking required minidisks; it will only access these minidisks if they are not accessed.

b If receiving the RSU from an **envelope** file, issue:

vmfins install ppf 4tcpip40 {tcpip | tcpipsfs} (nomemo nolink env rptfnum override no

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

nolink prevents VMFINS from linking required minidisks; it will only access these minidisks if they are not accessed.

- 2** Review the install message log (\$VMFINS \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview install

7.2.2.3 Apply the Service

Because service on the RSU is pre-applied, this step reapplies applicable reach-ahead service (service you have applied to your system that is not on the RSU).

- 1** Reapply reach-ahead service.

vmfapply ppf 4tcpip40 {tcpip | tcpipsfs}

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command reapplies the reach-ahead service on your system. The version vector table (VVT) is updated with serviced part information and all necessary AUX files are generated on the alternate apply disk.

- 2** Review the apply message log (\$VMFAPP \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview apply

- 3 Re-work and reapply local service, if it has been affected by RSU-provided service.
 - a. The output file created by the VMFPSU command (invoked in step 8 on page 54) identifies local modifications that are affected by RSU service.
 - b. For information on re-working local modifications, refer to Chapter 7 in the *z/VM: Service Guide* and follow the steps that are applicable to your local modification(s).

Note that when using this information, the following substitutions may need to be made:

- **zvm** should be: **4tcpip40**
- *compname* should be: **tcpip** or **tcpipsfs**
- *appid* should be: **4tcpip40**
- *fm-local* should be the file mode of the 2C4 minidisk
- *fm-applyalt* should be the file mode of the 2A6 minidisk

Keep in mind that when you reach this step in the *z/VM: Service Guide*:

- “Rebuilding Objects”

you should return to using this program directory and continue with step 7.2.2.4, “Update the Build Status Table.”

7.2.2.4 Update the Build Status Table

- 1 Update the Build Status Table for serviced parts.

vmfbld ppf 4tcpip40 {tcpip | tcpipsfs} (status

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command updates the Build Status Table to determine what objects (if any) remain to be built.

Note - \$PPF Service

If a \$PPF file has been serviced you will receive this prompt:

```
VMFBLD2185R The following source product parameter files have been
              serviced:
VMFBLD2185R 4TCPIP40 $PPF
VMFBLD2185R When source product parameter files are serviced, all
              product parameter files built from them must be recompiled
              using VMFPPF before VMFBLD can be run.
VMFBLD2185R Enter zero (0) to have the serviced source product
              parameter files built to your A-disk and exit VMFBLD so
              you can recompile your product parameter files with VMFPPF.
VMFBLD2185R Enter one (1) to continue only if you have already
              recompiled your product parameter files with VMFPPF.
```

0

Enter a zero (0) and complete the steps given here before you continue.

```
VMFBLD2188I Building 4TCPIP40 $PPF
              on 191 (A) from level $PFnnnnn
```

vmfppf 4tcPIP40 *

Note: If you've created your own PPF override, use your PPF name (for this command *only*) instead of 4TCPIP40.

copyfile 4tcPIP40 \$ppf a = d (olddate replace

erase 4tcPIP40 \$ppf a

Note: Do not use your own PPF name in place of 4TCPIP40 for these COPYFILE and ERASE commands.

vmfbld ppf 4tcPIP40 {tcpip | tcpipsfs} (status

1

Re-issue VMFBLD to complete updates to the build status table.

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

When you receive the previously displayed prompt, enter a one (1) and continue to the next step.

- 2 Use VMFVIEW to review the build status messages, and see what objects need to be built.

vmfview build

7.2.2.5 Build Serviced Objects

Because service on the RSU is pre-built, this step builds only objects which have been affected by any reach-ahead and local service that has been reapplied.

- 1 Ensure Language Environment for z/VM support is available if you are applying service to functions that require this support.
- 2 Rebuild TCP/IP for z/VM serviced parts.

vmfbld ppf 4tcpip40 {tcpip | tcpipsfs} (serviced

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

- 3 Review the build message log (\$VMFBLD \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview build

7.2.2.6 Test the New Service

All new service should be thoroughly test before it is placed into production. A suggested method for doing this is to temporarily link and then access the appropriate *test* build minidisks ahead of their *production* counterparts. Representative LINK and ACCESS statements for this purpose are illustrated here:

```

LINK TCPMAINT 198 198 RR
LINK 4TCPIP40 491 491 RR
LINK 4TCPIP40 492 492 RR
LINK TCPMAINT 591 591 RR
LINK TCPMAINT 592 592 RR
...
ACCESS 198 fm198 /* fm198 is 'D' (perhaps) */
ACCESS 491 fm491 /* fm491 is 'E' (perhaps) */
ACCESS 492 fm492 /* fm492 is 'F' (perhaps) */
ACCESS 591 fm591 /* fm591 is 'G' (perhaps) */
ACCESS 592 fm592 /* fm592 is 'H' (perhaps) */

```

- To facilitate the testing of new service that affects TCP/IP **server virtual machines**, a TCP/IP *server profile exit* (or the supplied sample *global profile exit*, TCPRUNXT SEXEC) could be used to establish a suitable environment, as part of server initialization (**SETUP**) processing. For information on these exits, see the chapter titled “General TCP/IP Server Configuration” in *z/VM: TCP/IP Level 440 Planning and Customization*.

When TCP/IP server and administrative functions are tested, ensure that the TCPMAINT 198, 4TCPIP40 491, and TCPMAINT 591 minidisks are accessed (in addition to the 4TCPIP40 492 and TCPMAINT 592 minidisks) by the TCP/IP service virtual machines and administrative user IDs involved in this activity.

- To facilitate the testing of new service that affects TCP/IP **client functions** (for example, the NETSTAT or FTP commands), only the 4TCPIP40 492 and TCPMAINT 592 minidisks need to be accessed (with respect to TCP/IP-specific minidisk requirements).

When new service is tested, consult any applicable documentation (for example, that provided with the APARs which comprise the service) to account for changes specific to new or changed function. Your testing may also require TCP/IP services affected by service to be shutdown and restarted, possibly more than once.

Note - Shutting Down TCP/IP Services

Before you shutdown any TCP/IP servers, ensure that applicable conditions or guidelines for your environment have been followed.

For information on shutting down TCP/IP servers, see the section that discusses “Starting and Stopping TCP/IP Servers” in the chapter titled “General TCP/IP Server Configuration,” of *z/VM: TCP/IP Level 440 Planning and Customization*.

7.2.2.7 Place the Service into Production

Once the new service has been thoroughly tested, it needs to be placed into production; complete the appropriate TCP/IP service instructions that remain to accomplish this.

RSU Service Instructions — Where To Next...

See 7.2.4, “Place the New TCP/IP for z/VM Service Into Production” on page 69 for instructions for completing the installation of RSU service.

7.2.3 Corrective (COR) Service for TCP/IP for z/VM

Corrective service for TCP/IP for z/VM is provided in COR format via tape or electronic envelope. It is installed using the VMSES/E VMFREC, VMFAPPLY, and VMFBLD commands.

Electronic Service (Envelope File)

If you have received service electronically or on CD-ROM, follow the appropriate instructions to retrieve and decompress the envelope files to your A-disk. Decompression is currently done by using the DETERSE module, which will produce decompressed files that have the following file name formats:

- *VLSTnum*, for the documentation envelope
- *VPTFnum*, for the service envelope.

The file type for both of these files is (and must be) SERVLINK. You will need to supply these file names with the VMFREC commands cited in these instructions.

7.2.3.1 Prepare to Receive Service

- 1** Log on the TCP/IP for z/VM service user ID, **4TCP40**.

The PROFILE EXEC provided for this user ID (as part of the z/VM Version 4 Release 4.0 System DDR) contains ACCESS commands for the required VMSES/E minidisks — the VMSES/E code minidisk (MAINT 5E5, by default) and the VMSES/E Software Inventory minidisk (MAINT 51D, by default).

- 2** Issue the CMS QUERY DISK command to verify the VMSES/E code and Software Inventory minidisks are correctly linked and accessed.

query disk

Verify the MAINT 5E5 minidisk is accessed as file mode **B**, and is linked **R/O**.

Verify the MAINT 51D minidisk is accessed as file mode **D**, and is linked **R/W**.

Note: If another user has the MAINT 51D minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the 51D disk in read-only (RR) mode, after which you need issue the appropriate LINK and ACCESS commands for the 51D minidisk. Do not continue with these procedures until a R/W link is established to the 51D minidisk.

3 If necessary, establish the appropriate access to the VMSES/E minidisks.

a Establish read access to the VMSES/E code minidisk.

```
link MAINT 5e5 5e5 rr
access 5e5 b
```

b Establish write access to the Software Inventory minidisk.

```
link maint 51d 51d mr
access 51d d
```

4 Have the TCP/IP for z/VM corrective (COR) service tape mounted and attached as 181 to **4TCPIP40**.

5 Mount the TCP/IP for z/VM corrective (COR) tape on an appropriate device and ensure this device has been attached to the **4TCPIP40** user ID using virtual device number 181.

6 Establish the correct minidisk access order.

vmfsetup 4tcpip40 {tcpip | tcpipsfs}

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

7 Receive the service documentation. The VMFREC command (with its INFO option) loads the service documentation and displays a list of all products for which service is present on the tape.

a If receiving service from **tape**, issue:

vmfrec info

This command loads the service memo to the 4TCPIP40 191 minidisk.

b If receiving service from an **envelope** file, issue:

vmfrec info (env vlstnum

This command loads the service memo to the 4TCPIP40 191 minidisk.

8 Review the receive message log (\$VMFREC \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview receive

Also, note the products and components for which service has been supplied on the tape. To do this, use the PF5 key to show all “status” messages, which will identify these products and components.

- 9** Clear the alternate APPLY disk to ensure that a clean minidisk exists for receipt of the new service. for new service.

vmfmrdsd 4tcpip40 {tcpip | tcpipsfs} apply

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command copies the alternate APPLY disk to the production APPLY disk and then clears the alternate APPLY disk.

- 10** Review the merge message log (\$VMFMRD \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview mrd

7.2.3.2 Receive the Service

- 1** Receive the service.

a If receiving service from **tape**, issue:

vmfrec ppf 4tcpip40 {tcpip | tcpipsfs}

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command receives service from the service tape. All new service is loaded to the DELTA disk.

b If receiving service from an **envelope** file, issue:

vmfrec ppf 4tcpip40 {tcpip | tcpipsfs} (env vptfnum

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command receives service from the service envelope. All new service is loaded to the DELTA disk.

- 2** Review the receive message log (\$VMFREC \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview receive

7.2.3.3 Apply the Service

- 1** Apply the new service.

vmfapply ppf 4tcpip40 {tcpip | tcpipsfs}

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command applies the just-received service. The version vector table (VVT) is updated with serviced part information and all necessary AUX files are generated on the alternate apply disk.

- 2** Review the apply message log (\$VMFAPP \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview apply

Note - Local Modifications

If you receive message VMFAPP2120W, you need to reapply any local modifications before building an updated level of TCP/IP for z/VM. For information on re-working local modifications, refer to Chapter 7 in the *z/VM: Service Guide* and follow the steps that are applicable to your local modification(s).

Note that when using this information, the following substitutions may need to be made:

- **zvm** should be: **4tcpip40**
- *compname* should be: **tcpip** or **tcpipsfs**
- *appid* should be: **4tcpip40**
- *fm-local* should be the file mode of the 2C4 minidisk
- *fm-applyalt* should be the file mode of the 2A6 minidisk

Keep in mind that when you reach this step in the *z/VM: Service Guide*:

- “Rebuilding Objects”

you should return to using this program directory and continue with step 7.2.3.4, “Update the Build Status Table” on page 65.

7.2.3.4 Update the Build Status Table

- 1 Update the Build Status Table for serviced parts.

vmfbld ppf 4tcpip40 {tcpip | tcpipsfs} (status

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

This command updates the Build Status Table to identify objects that need to be built as a result of applying new service.

Note - \$PPF Service

If a \$PPF file has been serviced you will receive this prompt:

```
VMFBLD2185R The following source product parameter files have been
              serviced:
VMFBLD2185R 4TCPIP40 $PPF
VMFBLD2185R When source product parameter files are serviced, all
              product parameter files built from them must be recompiled
              using VMFPPF before VMFBLD can be run.
VMFBLD2185R Enter zero (0) to have the serviced source product
              parameter files built to your A-disk and exit VMFBLD so
              you can recompile your product parameter files with VMFPPF.
VMFBLD2185R Enter one (1) to continue only if you have already
              recompiled your product parameter files with VMFPPF.
```

0

Enter a zero (0) and complete the steps given here before you continue.

```
VMFBLD2188I Building 4TCPIP40 $PPF
              on 191 (A) from level $PFnnnnn
```

vmfppf 4tcip40 *

Note: If you've created your own PPF override, use your PPF name (for this command *only*) instead of 4TCPIP40.

copyfile 4tcip40 \$ppf a = d (olddate replace

erase 4tcip40 \$ppf a

Note: Do not use your own PPF name in place of 4TCPIP40 for these COPYFILE and ERASE commands.

vmfbld ppf 4tcip40 {tcip | tcipsfs} (status setup

1

Re-issue VMFBLD to complete updates to the build status table.

Use **tcip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcipsfs** if the service minidisks were moved to Shared File System directories.

When you receive the previously displayed prompt, enter a one (1) and continue to the next step.

- 2 Use VMFVIEW to review the build status messages, and see what objects need to be built.

vmfview build

7.2.3.5 Build Serviced Objects

- 1 Ensure Language Environment for z/VM support is available if you are applying service to functions that require this support.
- 2 Rebuild TCP/IP for z/VM serviced parts.

vmfbld ppf 4tcpip40 {tcpip | tcpipsfs} (serviced Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

- 3 Review the build message log (\$VMFBLD \$MSGLOG). If necessary, correct any problems before you proceed with the next step. For information about handling specific error messages, see *z/VM: System Messages and Codes - Other Components* or use on-line HELP.

vmfview build

7.2.3.6 Test the New Service

All new service should be thoroughly test before it is placed into production. A suggested method for doing this is to temporarily link and then access the appropriate *test* build minidisks ahead of their *production* counterparts.

Representative LINK and ACCESS statements for this purpose are illustrated here:

```
LINK TCPMAINT 198 198 RR
LINK 4TCP40 491 491 RR
LINK 4TCP40 492 492 RR
LINK TCPMAINT 591 591 RR
LINK TCPMAINT 592 592 RR
...
ACCESS 198 fm198          /* fm198 is 'D' (perhaps) */
ACCESS 491 fm491          /* fm491 is 'E' (perhaps) */
ACCESS 492 fm492          /* fm492 is 'F' (perhaps) */
ACCESS 591 fm591          /* fm591 is 'G' (perhaps) */
ACCESS 592 fm592          /* fm592 is 'H' (perhaps) */
```

- To facilitate the testing of new service that affects TCP/IP **server virtual machines**, a TCP/IP *server profile exit* (or the supplied sample *global profile exit*, TCPRUNXT SEEXEC) could be used to establish a suitable environment, as part of server initialization (**SETUP**) processing. For information on these exits, see the chapter titled “General TCP/IP Server Configuration” in *z/VM: TCP/IP Level 440 Planning and Customization*.

When TCP/IP server and administrative functions are tested, ensure that the TCPMAINT 198, 4TCPIP40 491, and TCPMAINT 591 minidisks are accessed (in addition to the 4TCPIP40 492 and TCPMAINT 592 minidisks) by the TCP/IP service virtual machines and administrative user IDs involved in this activity.

- To facilitate the testing of new service that affects TCP/IP **client functions** (for example, the NETSTAT or FTP commands), only the 4TCPIP40 492 and TCPMAINT 592 minidisks need to be accessed (with respect to TCP/IP-specific minidisk requirements).

When new service is tested, consult any applicable documentation (for example, that provided with the APARs which comprise the service) to account for changes specific to new or changed function. Your testing may also require TCP/IP services affected by service to be shutdown and restarted, possibly more than once.

Note - Shutting Down TCP/IP Services

Before you shutdown any TCP/IP servers, ensure that applicable conditions or guidelines for your environment have been followed.

For information on shutting down TCP/IP servers, see the section that discusses “Starting and Stopping TCP/IP Servers” in the chapter titled “General TCP/IP Server Configuration,” of *z/VM: TCP/IP Level 440 Planning and Customization*.

7.2.4 Place the New TCP/IP for z/VM Service Into Production

7.2.4.1 4TCPIP40 CATALOG File Modification Notes

Before you continue with the steps in this section, it is recommended that you verify the correctness of any 4TCPIP40 CATALOG file modifications that may have been made for your environment; this file is used by the TCP2PROD command to copy files to TCP/IP for z/VM minidisks. See Appendix A, “TCP/IP Installation and Service Utilities” on page 77 for detailed information about the TCP2PROD command and TCP/IP for z/VM catalog files.

Any new files that can be processed will be identified within a serviced 4TCPIP40 CATALOG file.

The various definition sections of the 4TCPIP40 CATALOG file, and the files associated with each section, are briefly described here:

Section	Description
TCPCONFIG	Customizable sample files. For reference, files that can be processed using the TCPCONFIG section are listed in Figure 16 on page 47.
TCPHELP	TCP/IP CMS Help files. The TCP/IP CMS Help files processed via the TCPHELP section are listed in the TCPBLHLP VMSES/E build list.
TCPRUN	Non-customizable TCP/IP for z/VM run-time files. For reference, files that can be processed using the TCPRUN section are listed in Figure 15 on page 46.
TCPSVM	Non-customizable TCP/IP for z/VM run-time files that must reside on individual server virtual machine (SVM) minidisks. For reference, files that can be processed using the TCPSVM section are listed in Figure 14 on page 44.
TCPSYSFILE	Non-customizable TCP/IP (binary) system files. This section is not used at this time.

7.2.4.2 Copy Serviced TCP/IP for z/VM Run-time Files Into Production

Once the new service has been thoroughly tested, it needs to be placed into production (that is, copied to TCP/IP for z/VM production build minidisks).

1 Shutdown TCP/IP services.

Note - Shutting Down TCP/IP Services

Before you shutdown any TCP/IP servers, ensure any applicable conditions or guidelines for your environment have been followed.

For information on shutting down TCP/IP servers, see the section that discusses “Starting and Stopping TCP/IP Servers” in the chapter titled

“General TCP/IP Server Configuration,” of *z/VM: TCP/IP Level 440 Planning and Customization*.

2 Log on the TCP/IP for z/VM service user ID, **4TCPIP40**.

The PROFILE EXEC provided for this user ID (as part of the z/VM Version 4 Release 4.0 System DDR) contains ACCESS commands for the required VMSES/E minidisks — the VMSES/E code minidisk (MAINT 5E5, by default) and the VMSES/E Software Inventory minidisk (MAINT 51D, by default).

3 Issue the CMS QUERY DISK command to verify the VMSES/E code and Software Inventory minidisks are correctly linked and accessed.

query disk

Verify the MAINT 5E5 minidisk is accessed as file mode **B**, and is linked **R/O**.

Verify the MAINT 51D minidisk is accessed as file mode **D**, and is linked **R/W**.

Note: If another user has the MAINT 51D minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the 51D disk in read-only (RR) mode, after which you need issue the appropriate LINK and ACCESS commands for the 51D minidisk. Do not continue with these procedures until a R/W link is established to the 51D minidisk.

4 If necessary, establish the appropriate access to the VMSES/E minidisks.

a Establish read access to the VMSES/E code minidisk.

link MAINT 5e5 5e5 rr
access 5e5 b

b Establish write access to the Software Inventory minidisk.

link maint 51d 51d mr
access 51d d

5 Access the 4TCPIP40 491 minidisk.

access 491 i

The 491 minidisk is where the TCP2PROD EXEC and 4TCPIP40 CATALOG files reside.

6 Review the 4TCPIP40 CATALOG file to verify its correctness, as recommended in 7.2.4.1, “4TCPIP40 CATALOG File Modification Notes” on page 69. Ensure that any changes you may have made to this file remain in

effect, and that any local service used to customize this file has been properly re-worked and applied.

- 7** (*Optional*) Establish write links to any TCP/IP for z/VM production or server minidisks which are not yet linked in this mode.

LINK statements for the various TCP/IP for z/VM minidisks are present in the 4TCPIP40 directory entry (supplied as part of the installed z/VM Version 4 Release 4.0 System DDR).

If you have changed the default installation user ID or use different minidisk device numbers in your environment, you may need to manually link the necessary TCP/IP production and server minidisks. See Figure 14 on page 44, Figure 15 on page 46, and Figure 16 on page 47 for device link information. If you created a PPF override that has changed any of these device numbers, use your values.

```
link tcpipid vdev1 vdev2 mr
```

Note: If another user has the *vdev1* minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the *vdev1* disk in read-only (RR) mode, after which you need to re-issue the above LINK command. Do not continue with these procedures until a R/W link is established to the *vdev1* minidisk.

- 8 Copy serviced TCP/IP for z/VM files into production using the TCP2PROD command. The command cited below process files that are identified in the TCPRUN section of the 4TCPIP40 CATALOG file. See Appendix A, “TCP/IP Installation and Service Utilities” on page 77 for information about this command and TCP/IP for z/VM catalog files.

Verifying Your Environment

When you perform this step, it is suggested that you first invoke TCP2PROD as illustrated, but with the **TEST** option also specified. This will verify that all resources can be accessed and that the appropriate files will be processed.

With the **TEST** option in effect, **no files are copied into production.**

Resolve any reported problems, then invoke TCP2PROD (without the TEST option) as illustrated.

tcp2prod 4tcpip40 {tcpip | tcpipsfs} 4tcpip40 tcprun (setup

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

- 9 Review the TCP2PROD message log (TCP2PROD \$MSGLOG). If necessary, correct any problems before you proceed with the next step.

vmfview tcp2prod

7.2.4.3 Copy New TCP/IP for z/VM Configuration Files Into Production

Use the TCP2PROD command, as described in this section, to place any new IBM-supplied sample configuration files into production.

Note

When you perform this step, only *new* configuration files are copied into production. Existing (that is, customized) configuration files are *not* replaced.

Note: For step 2 below, it's assumed that the TCPCONFIG section of the 4TCPIP40 CATALOG has been verified, as recommended in 7.2.4.1, “4TCPIP40 CATALOG File Modification Notes” on page 69. If this is not the case, you should make any necessary changes to this section of the 4TCPIP40 CATALOG file before you continue with the steps that follow.

- 1 If necessary, establish the appropriate environment, as described by steps 1 through 5, in 7.2.4.2, “Copy Serviced TCP/IP for z/VM Run-time Files Into Production” on page 69.
- 2 Copy serviced TCP/IP for z/VM configuration files into production using the TCP2PROD command. For reference, files that can be processed using the TCPCONFIG section are listed in Figure 16 on page 47.

Verifying Your Environment

When you perform this step, it is suggested that you first invoke TCP2PROD as illustrated, but with the **TEST** option also specified. This will verify that all resources can be accessed and that the appropriate files will be processed.

With the **TEST** option in effect, **no files are copied into production.**

Resolve any reported problems, then invoke TCP2PROD (without the TEST option) as illustrated.

tcp2prod 4tcpip40 {tcpip | tcpipsfs} 4tcpip40 tcpconfig (setup

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

- 3 Review the TCP2PROD message log (TCP2PROD \$MSGLOG). If necessary, correct any problems before you proceed with the next step.

vmfview tcp2prod

7.2.4.4 Copy TCP/IP for z/VM CMS Help Files Into Production

Use the TCP2PROD command, as described below, place any new or serviced TCP/IP for z/VM CMS Help files into production.

Note: The steps described in this section are necessary **only** if service has been applied that has affected previously existing TCP/IP CMS Help files, or if additional (new) such files have been supplied.

- 1 If necessary, establish the appropriate environment, as described by steps 1 through 5, in 7.2.4.2, “Copy Serviced TCP/IP for z/VM Run-time Files Into Production” on page 69.

- 2 Copy serviced TCP/IP for z/VM CMS Help files into production using the TCP2PROD command.

Verifying Your Environment

When you perform this step, it is suggested that you first invoke TCP2PROD as illustrated, but with the **TEST** option also specified. This will verify that all resources can be accessed and that the appropriate files will be processed.

With the **TEST** option in effect, **no files are copied into production.**

Note that TEST mode processing for TCP/IP for z/VM system files is somewhat limited (as compared with conventional run-time and configuration files) due to the processing requirements and characteristics of these files.

Resolve any reported problems, then invoke TCP2PROD (without the TEST option) as illustrated.

tcp2prod 4tcpip40 {tcpip | tcpipsfs} 4tcpip40 tcphelp (setup

Use **tcpip** if the TCP/IP for z/VM default minidisk environment has been maintained; use **tcpipsfs** if the service minidisks were moved to Shared File System directories.

- 3 Review the TCP2PROD message log (TCP2PROD \$MSGLOG). If necessary, correct any problems before you proceed with the next step.

vmfview tcp2prod

- 4 Re-save the CMS saved system, to return the z/VM system HELP disk to shared status. See the “Placing (Serviced) Components into Production” section of the *z/VM: Service Guide* for detailed information about how to save the CMS saved system.

7.2.4.5 Configure TCP/IP for z/VM

If any configuration files you have previously customized have been affected by service, you should review the updated *sample* equivalents of the those files, and determine if any changes are required to your production files.

See *z/VM: TCP/IP Level 440 Planning and Customization* (SC24-6019) for detailed information about the content and use of these files, and how to configure specific TCP/IP servers for your environment. To accommodate service-related changes, you may at times need to consult APAR-specific documentation.

7.2.4.6 Re-Initialize TCP/IP Services

Once you have completed any necessary configuration changes, the appropriate TCP/IP servers must be initialized. For more information, see the section that discusses “Starting and Stopping TCP/IP Servers” in the chapter titled “General TCP/IP Server Configuration,” of *z/VM: TCP/IP Level 440 Planning and Customization*.

7.2.4.7 Copy Serviced TCP/IP Client Code to the z/VM Product Code Disk (Optional)

If you previously copied TCP/IP for z/VM client code to the z/VM product code disk, you should replace the appropriate files with their serviced counterparts. See Appendix H, “Copying TCP/IP for z/VM Client Code to the Y-Disk” on page 114 for additional information and instructions concerning this process.

7.2.4.8 Verify the RSU Service Level (Optional)

The procedures in this section describe how to determine the current TCP/IP for z/VM RSU service level by using either of these commands:

- TCP/IP **NETSTAT LEVEL**
- VMSES/E **VMFSIM QUERY**

The service contained on each RSU constitutes a new service level; this service level is updated in the system inventory when RSU service is installed.

Note: Corrective (COR) service does not affect the TCP/IP for z/VM RSU service level. However, you should record and use this service level when corrective (COR) service is ordered.

To use the TCP/IP **NETSTAT LEVEL** command to obtain the TCP/IP for z/VM RSU service level, the TCPIP server (or, the TCP/IP *stack*) must be operating and the NETSTAT command must be available.

access 592 *fm*
netstat level

where *fm* is an available file mode.

```
VM TCP/IP Netstat Level 440
IBM 2064; z/VM Version 4 Release 4.0, service level 0301 (nn-BIT), VM TCP/IP Level
440; RSU 0301 running TCPIP MODULE E2 dated 08/15/03 at 12:34
```

The last part of the returned output indicates the TCP/IP RSU service level; for this example, this is: **0301**

Note that any user ID that has the TCPMAINT 592 minidisk accessed can use the NETSTAT LEVEL command:

To use the **VMFSIM QUERY** command, the VMSES/E code (MAINT 5E5) and Software Inventory (MAINT 51D) minidisks must be accessed. Thus, this command is more readily issued while logged on the TCP/IP installation user ID, **4TCPIP40**.

vmfsim query vm sysrecls tdata :ppf 4tcpip40 :stat

```
VMFSIP2408I RESULTS FOR
      TDATA :PPF 4TCPIP40 :STAT
:PPF 4TCPIP40 TCPIP
:STAT RECEIVED.12/01/03.01:23:45.4TCPIP40.RSU-0301
```

The last part of the status line indicates the TCP/IP RSU service level; for this example, this is: **0301**

You have finished servicing TCP/IP for z/VM.

Appendix A. TCP/IP Installation and Service Utilities

A.1 TCP2PROD

A.1.1 Purpose

Use the TCP2PROD command to help you place TCP/IP for z/VM files into production. The TCP2PROD command uses a TCP/IP for z/VM CATALOG file to determine which product files are to be placed into production, as well as which minidisks and SFS directories are to be used for this process.

When TCP/IP for z/VM (binary) system files are processed, TCP2PROD also serves as a VMSES/E *part handler*, in that it manages build status information (maintained in the 4TCPIP40 SRVBLDS file) for these types of files.

Note: The TCP2PROD command is intended for use by the 4TCPIP40 user ID, and should only be used when you install or service TCP/IP for z/VM.

A.1.2 Operands

ppfname is the name of the usable form product parameter file used for installing and maintaining TCP/IP for z/VM; the file type must be **PPF**.

compname is the name of the component as specified on the :COMPNAME. tag in the product parameter file; *compname* is a 1- to 16-character alphanumeric identifier.

The PPF Variable Declarations (:DCL.) section defined for *compname* determines from which source minidisks and SFS directories product files are copied; likewise for the target minidisks to which these files are copied.

ctlg_name is the name of the product catalog file to be processed. The file type must be CATALOG.

ctlg_section is the definition section of the catalog file to be processed. The value specified by *ctlg_section* is used as a “root” for the *begin* and *end* tags that define each section of grouped entries (records) within a catalog file.

A.1.3 Options

BUILDAll

causes TCP2PROD to rebuild (binary) system files that correspond to entries defined within a *system file* section of the TCP/IP for z/VM CATALOG file, regardless of the VMSES/E build status for these objects. This option is has no effect when other types of catalog entries are processed.

DEBUG

TRACE

causes additional messages to be issued to provide information for debugging purposes. The TRACE option is synonymous with the DEBUG option.

FORCECopy

REPLace

causes files identified within a CATALOG *configuration file* definition section to be copied to their configured name and type, regardless of whether such a configuration file already exists. The REPLACE option is synonymous with the FORCECOPY option.

NOPrompt

prevents TCP2PROD from issuing prompts through the course of its processing. When this option is used, TCP2PROD assumes an *affirmative response (1)* for any prompts that are bypassed. In addition, appropriate informational messages are issued in place of the usual prompts.

SETUP

causes a VMSES/E **VMFSETUP (LINK** command to be issued as part of TCP2PROD processing, so that the correct operational environment is established. The *ppfname* and *compname* supplied when TCP2PROD is invoked are used as operands for the VMFSETUP command.

TEST

causes processing to be performed so that no files are placed into production via the VMSES/E VMFCOPY command (for conventional files), or through TCP2PROD-inherent processing (used for system files). This option allows you to verify that minidisks and SFS directories can be accessed as required, and that the appropriate catalog file entries will be processed. Additional messages are issued in some cases to clarify what processing would be performed if the TEST option was not used.

Note: TEST mode processing for TCP/IP for z/VM system files is somewhat limited (as compared with that for conventional run-time and configuration files) due to the processing requirements and characteristics of these files.

A.1.4 Usage Notes

- **TCP2PROD does not issue LINK commands** for minidisks as part of its processing.

If necessary, the appropriate LINK statements should be added to the 4TCPIP40 directory entry. Alternatively, the required LINK commands can be added to the PROFILE EXEC of the 4TCPIP40 user ID.

- The first CATALOG file found in the CMS search order that matches the name specified by *ctlg_name* is used.
- CATALOG file entries which are found to be unusable are bypassed. Warning messages are issued when entries are bypassed for this reason.
- A minidisk or directory must be accessed at file mode A with Read/Write (R/W) status, for use as temporary work space and for message logging.
- By default, a file identified within a *configuration file* definition section of a CATALOG file is copied to its configured name and type only if the configured file does not already exist.

A catalog section is considered to be a *configuration file* definition section if its corresponding *begin* tag contains the string, **CONFIG**. For more information about CATALOG file structure and content, see A.2, “TCP/IP for z/VM CATALOG Files” on page 81.

- TCP2PROD processes system files by first decompressing service-level files to a temporary work space (file mode A) and then creating an appropriate binary image file under a unique CMS file name (for which a corresponding CMS minidisk has been reserved). At the same time, TCP2PROD serves as a VMSES/E *part handler*, in that it manages build status information (maintained in the 4TCPIP40 SRVBLDS file) for these types of files. By design, only files that are identified within a *system file* definition section of a CATALOG file are processed in this manner.

A catalog section is considered to be a *system file* definition section if its corresponding *begin* tag contains the string, **SYSFILE**. For more information about CATALOG file structure and content, see A.2, “TCP/IP for z/VM CATALOG Files” on page 81.

- If TCP2PROD is invoked with *ppfname* specified as a question mark (?), the command syntax is displayed.

A.1.5 The TCP2PROD \$MSGLOG File

Informational, warning and error messages issued to the console by TCP2PROD are maintained in a message log, TCP2PROD \$MSGLOG. This log file is written to the minidisk or directory accessed at file mode A, and can be viewed using the VMSES/E **VMFVIEW** command.

The TCP2PROD \$MSGLOG is cumulative, with the most recent entries appended at the **top** of the file. Separator headers that include date and time stamps are inserted in the log with each TCP2PROD invocation so that newer log entries can be distinguished from older ones.

No messages are logged until an initial validation of TCP2PROD operands is complete.

A.1.6 Return Codes

The return codes that can be produced by TCP2PROD are listed and explained here:

0

Explanation: Successful execution; no processing errors were encountered.

1

Explanation: Incorrect invocation. TCP2PROD was invoked with an incorrect number of operands. A message that identifies the missing operand is displayed, in addition to the command syntax.

2

Explanation: Internal error. If return code 2 is returned, processing status is unknown. Contact the TCP/IP for z/VM support group for problem determination and assistance in addressing this type of error.

4

Explanation: Errors encountered, with warnings issued. The errors encountered may have caused processing to complete with only partial success. Review the TCP2PROD \$MSGLOG for warning messages which identify any problems that were encountered.

8

Explanation: Errors encountered; processing has not completed successfully. Review the TCP2PROD \$MSGLOG for messages regarding the problems encountered.

A.2 TCP/IP for z/VM CATALOG Files

A.2.1 Purpose

THE TCP/IP for z/VM CATALOG file is used by TCP2PROD to determine which TCP/IP for z/VM product files are to be placed into production, as well as which minidisks and SFS directories are to be used for this process.

CATALOG files provided for use with TCP/IP for z/VM are listed in Figure 17.

<i>Figure 17. TCP/IP for z/VM CATALOG Files</i>	
Catalog File Name / Type	Associated Files
4TCPIP40 CATALOG	TCP/IP for z/VM files

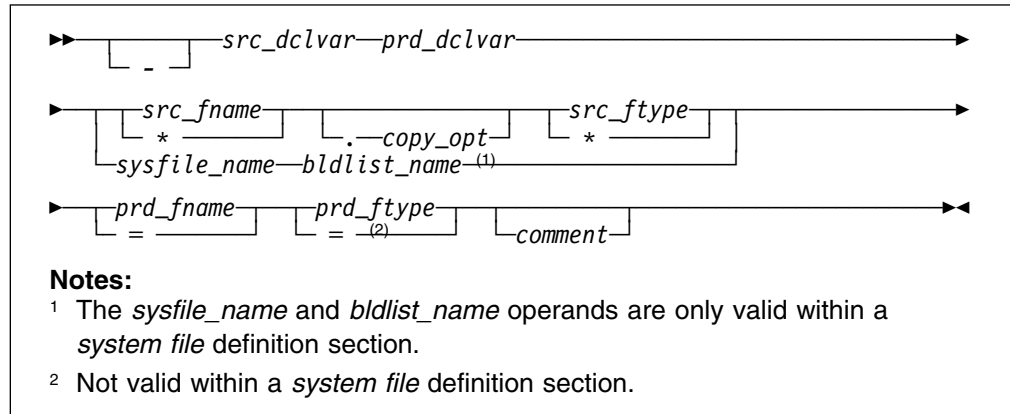

Distinct sections within the CATALOG file are used to identify *product* files, such as the TCPIP MODULE, and *sample* files which need to be customized, such as the TCPIP SDATA file. Each definition section is delimited by a pair of *begin* and *end* tags. For example, the definition section for TCP/IP for z/VM sample configuration files is defined using the :TCPCONFIG. and :ETCPCONFIG. tags.

The entries within each section provide information sufficient for TCP2PROD to process a specific group of TCP/IP files.

Unless marked otherwise, all entries within a given section are processed and the corresponding files are placed into production via the VMSES/E VMFCOPY command (for conventional files) or through additional processing inherent to the TCP2PROD command (for system files).

A.2.2 CATALOG Record Syntax

The syntax for TCP/IP for z/VM CATALOG file entries is indicated below.

A.2.3 Operands

- is the entry bypass character, a hyphen (-). Use this bypass character at the beginning of a file entry to indicate it should *not* be processed by TCP2PROD.
Note: It's recommended that all file entries remain present within any supplied TCP/IP for z/VM CATALOG files. If a TCP/IP for z/VM file is not used in your environment, its corresponding entry should be bypassed as described above. Doing so will also help readily distinguish comment lines from entries that correspond to TCP/IP for z/VM product files.
- src_dclvar* is a PPF :DCL. variable name for the minidisk or SFS directory where the source file resides.
- prd_dclvar* is a PPF :DCL. variable name for the minidisk or SFS directory where the production or configured file is to reside.
- src_fname* is the source file name. An asterisk (*) can be used to indicate that all files of the type specified by *src_ftype* are to be processed. When this wildcard (*) is used, the production or configured file name remains unchanged from the source file name.
- copy_opt* is an optional qualifier that identifies a CMS COPYFILE option to be applied when the associated file is processed. If used, this qualifier **must** be concatenated to the end of the *src_fname* operand, using an intervening period (.) as a separator. At this time, the only recognized qualifier is **UP**, which corresponds to the COPYFILE **UPCASE** option.

src_ftype is the source file type. An asterisk (*) can be used to indicate that all files of the name specified by *src_fname* are to be processed. When this wildcard (*) is used, the production or configured file type remains unchanged from the source file type.

prd_fname is the configured file name. If the source file name is specified using an asterisk (*), *prd_fname* must be specified to maintain the correct entry format. In such cases, an equal sign (=) should be used; a value other than an equal sign is processed as if an equal sign had been specified.

prd_ftype is the production or configured file type. If the source file type is specified using an asterisk (*), *prd_ftype* must be specified to maintain the correct entry format. In such cases, an equal sign (=) should be used; a value other than an equal sign is processed as if an equal sign had been specified.

Note: An equal sign cannot be used to specify a production file type within a *system file* definition section; a “conventional” CMS file type must be specified within this type of definition section.

sysfile_name is the file name of a (binary) source system file. This operand is only valid within a *system file* definition section.

bldlist_name is the name of the VMSES/E build list with which a preceding *sysfile_name* file is associated. For TCP/IP for z/VM system files, a one-to-one correspondence exists for a given build list and a given system file. This operand is only valid within a *system file* definition section.

comment commentary text that is ignored by TCP2PROD during processing.

Notes:

1. All operands must be separated by at least one space.
2. Comment lines may be included in CATALOG files. Comment lines must begin with an asterisk (*); these lines are ignored during TCP2PROD processing.

A.2.4 Usage Notes

- TCP/IP for z/VM CATALOG file changes that are required for your environment should be made via a VMSES/E local modification, to allow for the reporting of service-related changes during VMSES/E processing. See Appendix B, “Modifying TCP/IP for z/VM CATALOG Files” on page 89 for more information about how to change a TCP/IP for z/VM CATALOG file in this manner.

- The source and target minidisk/directory variable names used within this file correspond to those used within the TCP/IP for z/VM (\$)PPF file (or an override variation of that file). If any changes are made to the Variable Declarations (:DCL.) section of the TCP/IP for z/VM PPF file via a PPF override, you may need to incorporate similar changes within TCP/IP for z/VM CATALOG files (through separate VMSES/E local modifications) to allow for the correct resolution of PPF :DCL. variable names.

A.2.5 Additional Information

The various definition sections of the 4TCPIP40 CATALOG file, and the files associated with each section, are briefly described here:

Section	Description
TCPCONFIG	Customizable sample files. For reference, files that can be processed using the TCPCONFIG section are listed in Figure 16 on page 47.
TCPHELP	TCP/IP CMS Help files. The TCP/IP CMS Help files processed via the TCPHELP section are listed in the TCPBLHLP VMSES/E build list.
TCPRUN	Non-customizable TCP/IP for z/VM run-time files. For reference, files that can be processed using the TCPRUN section are listed in Figure 15 on page 46.
TCPSVM	Non-customizable TCP/IP for z/VM run-time files that must reside on individual server virtual machine (SVM) minidisks. For reference, files that can be processed using the TCPSVM section are listed in Figure 14 on page 44.
TCPSYSFILE	Non-customizable TCP/IP (binary) system files. This section is not used at this time.

Notes:

1. To ensure you are notified of any service-related changes to the 4TCPIP40 CATALOG file, make changes to this file using a **VMSES/E local modification**. See Appendix B, “Modifying TCP/IP for z/VM CATALOG Files” on page 89 for information about how to change the 4TCPIP40 CATALOG file in this manner.
2. When changes are made, ensure the only files identified for TCP2PROD processing are those associated with the servers defined for your environment.
3. The TCP2PROD command is not used to install files that are associated with TCPSYSFILE section of the 4TCPIP40 CATALOG file; these files are already present in an appropriate state (due to inclusion of TCP/IP for z/VM as part of the z/VM Version 4 Release 4.0 System DDR).

A.3 TCPCMLST

▶—TCPCMLST—*ppfname*—*ftype_abbrev*—*fm*—▶

A.3.1 Purpose

Use the TCPCMLST command to generate a file that lists PTF-numbered parts for which VMSES/E COMMIT processing may be applicable. The generated file (*ppfname* \$REMLIST) can be used as input to the VMSES/E **VMFREM** command, which commits specific service levels for your maintenance environment.

Note: The TCPCMLST command is intended for use by the 4TCPIP40 user ID, and should only be used when you commit service levels for TCP/IP for z/VM files.

A.3.2 Operands

ppfname is the name of the usable form product parameter file used for installing and maintaining TCP/IP for z/VM; the file type must be **PPF**.

ftype_abbrev is the 3-character abbreviation used for PTF-numbered files that correspond to the “real” (or, *base*) CMS file types used for TCP/IP for z/VM files. For example, **RPM** is the part-type abbreviation used for TCP/IP parts that have a base file type of **RPMBIN**. The mapping of file type abbreviations and their corresponding base file types can be found in the VM SYSABRVT file.

fm is the file mode of the minidisk or directory on which PTF-numbered parts of concern are maintained. By convention, this is the TCP/IP for z/VM **DELTA** minidisk (**4TCPIP40 2D2**, by default) or an equivalent SFS directory.

A.3.3 Usage Notes

- A minidisk or directory must be accessed at file mode A with Read/Write (R/W) status, to allow for the creation of files by TCPCMLST.
- TCPCMLST creates the files listed in Figure 18 (dependent upon current maintenance circumstances):

Figure 18. TCPCMLST - Generated Files

File Name / File Type	Content
<i>ppfname</i> \$REMLIST	Lists PTFs that are candidates for commit processing. This file is created when PTF-numbered parts exist that correspond to the selected <i>ftype_abbrev</i> abbreviation).
<i>ppfname</i> \$CMLSTLG	Lists PTFs identified for commit processing through prior TCPCMLST invocations. This file is produced (or updated) when a <i>ppfname</i> \$REMLIST file already exists and PTF commit candidates are identified by TCPCMLST.
<i>ppfname</i> \$BASLIST	Lists base-level parts that can be removed <i>after</i> commit processing has been completed for PTFs listed in the <i>ppfname</i> \$REMLIST file. The base-level parts listed correspond to one (or more) of the listed PTF-numbered parts.
<i>ppfname</i> \$CMBASLG	Lists base-level parts identified for removal through prior TCPCMLST invocations. This file is produced (or updated) when a <i>ppfname</i> \$BASLIST file already exists and TCPCMLST is invoked and base-level removal candidates are identified along with PTF commit candidates.

- If TCPCMLST is invoked with *ppfname* specified as a question mark (?), the command syntax is displayed.

A.3.4 Return Codes

The return codes that can be produced by TCPCMLST are listed and explained here:

0

Explanation: Successful execution; no processing errors were encountered.

1

Explanation: Incorrect invocation. TCPCMLST was invoked with an incorrect number of operands. A message that identifies the missing operand is displayed, in addition to the command syntax.

2

Explanation: Internal error. If return code 2 is returned, processing status is unknown. Contact the TCP/IP for z/VM support group for problem determination and assistance in addressing this type of error.

Explanation: Errors encountered; processing has not completed successfully.

A.4 TCPSLVL

▶—TCPSLVL—*part_fn*—*part_ft*—*part_fm*—▶

A.4.1 Purpose

Use the TCPSLVL command to display service information that is intrinsic to a TCP/IP executable MODULE file. The information presented is obtained from data that is embedded within the various TEXT decks (files) that comprise a given MODULE.

Note: The TCPSLVL command is intended for use as a diagnostic aid, in consultation with the IBM TCP/IP support group.

When TCPSLVL examines the MODULE you specify, it produces an output line for each TEXT deck in which maintenance data is present. Each line begins with the keyword **SLVL**, followed by the name of a TEXT deck, and its corresponding service indicator. This indicator may reflect either an Authorized Program Analysis Report (APAR) number or an IBM development tracking number. This information, taken as a whole, then can provide an overall (or perhaps, “rule of thumb”) indication of the service that is incorporated within a given module.

As an example, this TCPSLVL command will check the service content of the LPR MODULE that resides at file mode “P”:

```
tcpslv1 lpr module p
```

For this command, the results produced might be:

```
SLVL LPRP      PQ39574
SLVL CMHOSTN  MT01181
SLVL CMRESOL  PQ28862
```

In this example, APAR level numbers for the LPRP and CMRESOL TEXT files are listed; for the CMHOSTN TEXT file, an internal IBM development tracking number is shown.

A.4.2 Operands

<i>part_fn</i>	the file name of the TCP/IP executable file from which service information is to be obtained.
<i>part_ft</i>	the file type of the TCP/IP file from which service information is to be obtained. Internal service information is available for only TCP/IP MODULE files.
<i>part_fm</i>	the file mode of the minidisk or directory on which the file of interest resides. When specified as an asterisk (*), the first file present in the current search order, which matches the provided <i>part_fn</i> and <i>part_fm</i> , is evaluated.

A.4.3 Usage Notes

The TCPSLVL command and the information it provides are intended to supplement the information and files that are maintained or used by VMSES/E and its various utilities. TCPSLVL data should be used, at most, only to form generalizations about the service content of TCP/IP modules.

A.4.4 Return Codes

The return codes that can be produced by TCPSLVL are listed and explained here:

0

Explanation: Successful execution; no processing errors were encountered.

1

Explanation: Incorrect invocation / "Help" was requested. TCPSLVL was invoked with an incorrect number of operands, or was invoked with a question mark (?) as the first (or only) operand. In response, the command syntax is displayed.

nn

Explanation: Processing error. A nonzero return code (other than 1) indicates a problem was encountered when the file was evaluated. Such a return code will be presented when the specified file cannot be located, or when an error occurs when file contents are examined.

Appendix B. Modifying TCP/IP for z/VM CATALOG Files

This appendix describes how to create a VMSES/E local modification for TCP/IP for z/VM CATALOG files, which are provided as replacement-maintained (or, “full-source”) objects. This procedure can also be used to modify other replacement-maintained TCP/IP for z/VM files, such as sample files.

The example provided in this appendix describes how to modify the 4TCPIP40 CATALOG file to prevent files associated with the BOOTP server will from being processed by the TCP2PROD EXEC.

For more information about installing and maintaining local modifications, see Chapters 5, 6, and 7 of the *z/VM: Service Guide* (GC24-5993).

Notes:

1. Throughout this procedure, references are made to several TCP/IP for z/VM installation minidisks. Default device numbers (and equivalent SFS directories, when applicable) for these minidisks are listed in the tables in 5.3, “DASD Storage and User ID Requirements” on page 28.
2. VMSES/E local modifications require a modification identifier (or, *modid*) to be associated with the parts affected by a change; *modid* is a locally-determined value. It should begin with **L**, and is followed by up to 4 alphanumeric characters that identify a specific local modification. For example, L0001.

1 Log on the installation user ID, **4TCPIP40**.

The PROFILE EXEC provided for this user ID (as part of the z/VM Version 4 Release 4.0 System DDR) contains ACCESS commands for the required VMSES/E minidisks — the VMSES/E code minidisk (MAINT 5E5, by default) and the VMSES/E Software Inventory minidisk (MAINT 51D, by default).

2 Issue the CMS QUERY DISK command to verify the VMSES/E code and Software Inventory minidisks are correctly linked and accessed.

query disk

Verify the MAINT 5E5 minidisk is accessed as file mode **B**, and is linked **R/O**.

Verify the MAINT 51D minidisk is accessed as file mode **D**, and is linked **R/W**.

Note: If another user has the MAINT 51D minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the 51D disk in read-only (RR) mode, after which you need issue the appropriate LINK and ACCESS commands for the 51D minidisk. Do not continue with these procedures until a R/W link is established to the 51D minidisk.

3 If necessary, establish the appropriate access to the VMSES/E minidisks.

a Establish read access to the VMSES/E code minidisk.

```
link MAINT 5e5 5e5 rr
access 5e5 b
```

b Establish write access to the Software Inventory minidisk.

```
link maint 51d 51d mr
access 51d d
```

4 Create a usable PPF file.

Note: This VMFPPF step is necessary **only** if you have made changes to the PPF file since it was last compiled.

vmfppf *ppfname compname*

where:

- *ppfname* is the name of a PPF file that corresponds to the configuration file to be modified. For example, **4tcpip40**. If you have created an override PPF file, use your override file name.
- *compname* is the installed component name with which the configuration file is associated. For example, for TCP/IP for z/VM (4TCPIP40), you would use either: **tcpip** or **tcpipsfs**

5 Establish the correct minidisk access order.

vmfsetup *ppfname compname*

ppfname and *compname* are the same as described in step 4.

- 6 Copy the highest level of the file to be modified to the local modification (LOCALMOD) minidisk, with the correct file type for the replacement part.

vmfrepl *fn ft ppfname compname (\$select logmod modid outmode localmod*

where:

- *fn* and *ft* are the real file name and file type of the file being modified. For example:
4TCPIP40 CATALOG
- *ppfname* and *compname* are the same as described in step 4 on page 90.
- *modid* is the local modification identifier for this part. (*modid* is described in note 2 on page 89).
- **localmod** is the symbolic name for the local modification disk in the :MDA. section of the 4TCPIP40 PPF file.

- 7 XEDIT the part just copied to the LOCALMOD disk, so you can make (and then file) your changes.

xedit *fn ftabbrv-modid fm-local*

The file ID (*fn ftabbrv-modid fm-local*) is returned in message VMFREP2507I. For example:
4TCPIP40 CATL0001 E

8 Make your changes to the displayed file.

For example, assume you've chosen to not use the BOOTP server provided with TCP/IP for z/VM, because you are instead using the supplied DHCP server. To avoid TCP2PROD processing of files associated with the BOOTP server, you need to bypass the 4TCPIP40 CATALOG file shown here:

```
:TCPSVM.  
...  
- &BLD1Z &DISK4 TCPROFIL EXEC PROFILE = BOOTPD  
...  
:ETCPSVM.  
...  
...  
:TCPCONFIG.  
...  
- &BLD0Z &BLD4Z BOOTPTAB SAMPLE ETC BOOTPTAB BOOTPD  
...  
:ETCPCONFIG.
```

9 When you have completed your changes, save the replacement part.

====> file

10 Rebuild the Modified Objects

Note

When you have completed steps 6 through 9 for all of the local modifications necessary for this component, then rebuild these objects.

Build the modified (or, serviced) configuration file(s).

vmfbld ppf ppfname compname (serviced

Appendix C. Modifying the TCP/IP for z/VM Default Installation

As the installation and configuration of TCP/IP for z/VM is completed, you may identify one or more TCP/IP services that are not required for your installation. Alternatively, it may be desirable (or necessary) to modify certain aspects of the TCP/IP default installation, to meet requirements that are specific to your organization.

If you choose to modify or eliminate any of the IBM-supplied resources for TCP/IP for z/VM, the changes outlined here should be considered prior to making any changes.

Note — z/VM Automated Service Procedure

If you modify any of the IBM-supplied user IDs, minidisk addresses, or SFS directory names that are associated with TCP/IP for z/VM and you plan on using the z/VM automated service procedure (the **SERVICE** and **PUT2PROD** commands) to service your z/VM system, then you must create a PPF override for the **SERVP2P \$PPF** file.

You must also use the **VMFUPDAT** command to update the VM SYSSUF software inventory file, so that your PPF override of SERVP2P PPF is used for automated service processing. For more information about PPF file overrides, see the *z/VM: VMSES/E Introduction and Reference*

- The **4TCPIP40** user ID is the IBM-supplied user ID for installing and servicing TCP/IP for z/VM. If you choose to use a different user ID or you elect to use different minidisks and/or SFS directories for TCP/IP for z/VM maintenance purposes, suitable PPF overrides must be implemented to reflect your changes.

Note: If you choose to use an existing or “common-use” user ID (such as the MAINT user ID) to install and maintain TCP/IP for z/VM, minidisks may already be defined which have device numbers that conflict with TCP/IP for z/VM minidisk defaults. If such minidisks exist, you will need to create a PPF override to change the TCP/IP default minidisk device numbers so they are unique within your environment.

- If you choose to use user IDs for TCP/IP server virtual machines that differ from the IBM-supplied user IDs shown in Figure 11, review the section titled “Implications of Assigning Different Server Virtual Machine Names” in Chapter 1 of *z/VM: TCP/IP Level 440 Planning and Customization*.
- Note the following, with regard to the user ID and minidisk information provided in Figure 11 on page 32 of 5.3.1, “DASD Requirements for TCP/IP for z/VM”:

Specific Minidisk Requirements

Certain minidisks **must** be defined for the TCP/IP server machines you choose to use, as well as for maintaining TCP/IP for z/VM in your environment. Such minidisks **cannot** be replaced with an equivalent SFS directory.

Minidisks to which this requirement applies are listed in Figure 11 with **boldface** virtual device numbers. In addition, no default SFS directory names or SFS 4K block values are provided for these minidisks.

- The minidisks that are associated with the **4TCPIP40**, **TCPMaint**, and **TCPIP** user IDs (or your chosen equivalents) **must** be maintained in order to provide TCP/IP services within your environment. The remaining user IDs listed in Figure 11 on page 32 of 5.3.1, “DASD Requirements for TCP/IP for z/VM” are associated with servers and clients that provide optional TCP/IP for z/VM services.
- To identify TCP/IP services that are not required for your installation, review the service descriptions provided in *z/VM: TCP/IP Level 440 Planning and Customization* (SC24-6019). The server-specific configuration chapters of this publication may also help you with determining whether a service or its resources can (or should) be removed.
- Suitable **4TCPIP40 \$PPF** file overrides are necessary to avoid references to any TCP/IP user ID that is removed, or to account for any user IDs that are changed. This also applies to the removal of any minidisks that are uniquely associated with such user IDs.

If such overrides are created, the **VMFPPF** command must be used to generate a compiled PPF file that corresponds to your override file name, as well as to create an updated **SERV2P** PPF file, for use by the VMSES/E SERVICE command.

- The z/VM Version 4 Release 4.0 system directory entry for the **4TCPIP40** user ID (or its equivalent) should be modified such that LINK statements to any removed minidisks are no longer present.
- The z/VM Version 4 Release 4.0 system directory entry for the **MAINT** user ID (or its equivalent) should be modified such that LINK statements to any removed minidisks are no longer present.
- The content of the 4TCPIP40 CATALOG file (used by the TCP2PROD command to copy files into production) should be reviewed for correctness. It may be necessary to modify this file (via a VMSES/E local modification) to bypass references to files that correspond to any TCP/IP user ID that is removed, as well as to any minidisks that are uniquely associated with that user ID. See Appendix A, “TCP/IP Installation and Service Utilities” on page 77 for information about the TCP2PROD command and TCP/IP for z/VM catalog files.

Appendix D. Making Local Modifications to TCP/IP for z/VM Modules

This appendix provides information to assist you in making local modifications to TCP/IP for z/VM modules, and is intended to supplement the local modification process described in Chapter 6, “Procedures for Local Service” of the *z/VM: Service Guide* (GC24-5993). The process described herein is oriented toward local service that is implemented through:

- TEXT file **replacement** — when an existing TCP/IP TEXT file is fully replaced and the file name of the existing TEXT file remains unchanged
- **local updates** to the source for an existing TEXT file (so that a “local replacement” is effectively created)
- TEXT file **substitution** or **addition**, in which an existing TCP/IP TEXT file is fully replaced by one or more new, differently-named TEXT files.

With regard to the latter two types of modification, additional steps to accommodate changes to TCP/IP C and Pascal-based modules or added TEXT files are provided.

When to Use This Information

In general, the VMSES/E local modification process as documented in Chapter 6, “Procedures for Local Service” of the *z/VM: Service Guide* should be used when local modifications are made. *This is especially true* for **common** part types — such as EXEC and ASSEMBLE files — for which VMSES/E itself provides appropriate part handlers.

However, C or Pascal-specific VMSES/E part handlers are not available for TCP/IP **C** and **Pascal** source parts, so local modifications to TCP/IP for z/VM modules based on these languages cannot be processed completely within the VMSES/E environment. Instead, the VMFC and VMFPAS execs provided with TCP/IP for z/VM can be used to facilitate local modifications to its C and Pascal-based modules. Additional steps which make use of these execs, are included in this appendix to help you modify TCP/IP C or Pascal-based objects.

Information about the VMFC and VMFPAS execs can be found in the chapter titled “Using Source Code Libraries,” of *z/VM: TCP/IP Level 440 Planning and Customization* (SC24-6019).

Note that VMFC and VMFPAS are **not** “VMSES/E-compliant” part handlers. They do not process source files in the same manner as VMSES/E part handlers (for example, by using VMFEXUPD); nor do they produce object (TEXT) files that comply with VMSES/E maintenance naming conventions (such as file abbreviations and part numbering). Therefore, several manual steps are required to ensure the TEXT files produced by VMFC and VMFPAS can be used as part of the VMSES/E maintenance process.

For detailed information about installing and maintaining local modifications, see Chapters 5, 6, and 7 of the *z/VM: Service Guide*.

Notes:

1. Throughout this procedure, references are made to several TCP/IP for z/VM installation minidisks. Default device numbers, and equivalent SFS directories (when applicable), for these minidisks are listed in the tables in 5.3, "DASD Storage and User ID Requirements" on page 28.
2. VMSES/E local modifications require a modification identifier, or *modid*, to be associated with the parts affected by a change; *modid* is a locally-determined value. It should begin with **L**, and is followed by up to 4 alphanumeric characters that identify a specific local modification. For example: L0002

D.1.1 Prepare for Local Service

- 1** Log on the installation user ID, **4TCPIP40**.

The PROFILE EXEC provided for this user ID (as part of the z/VM Version 4 Release 4.0 System DDR) contains ACCESS commands for the required VMSES/E minidisks — the VMSES/E code minidisk (MAINT 5E5, by default) and the VMSES/E Software Inventory minidisk (MAINT 51D, by default).

- 2** Issue the CMS QUERY DISK command to verify the VMSES/E code and Software Inventory minidisks are correctly linked and accessed.

query disk

Verify the MAINT 5E5 minidisk is accessed as file mode **B**, and is linked **R/O**.

Verify the MAINT 51D minidisk is accessed as file mode **D**, and is linked **R/W**.

Note: If another user has the MAINT 51D minidisk linked in write (R/W) mode, you'll obtain only read (R/O) access to this minidisk. If this occurs, have that user re-link the 51D disk in read-only (RR) mode, after which you need issue the appropriate LINK and ACCESS commands for the 51D minidisk. Do not continue with these procedures until a R/W link is established to the 51D minidisk.

- 3** If necessary, establish the appropriate access to the VMSES/E minidisks.

- a** Establish read access to the VMSES/E code minidisk.

```
link MAINT 5e5 5e5 rr
access 5e5 b
```

- b** Establish write access to the Software Inventory minidisk.

```
link maint 51d 51d mr
access 51d d
```

4 Create a usable PPF file.

Note: This VMFPPF step is necessary **only** if you have made changes to the PPF file since it was last compiled.

vmfppf *ppfname compname*

where:

- *ppfname* is the name of a PPF file that corresponds to the source file to be modified. For example, **4tcpip40**. If you have created an override for the PPF file in question, use your override file name.
- *compname* is the installed component name with which the source file is associated. For example, for TCP/IP for z/VM (4TCPIP40), you would use either: **tcpip** or **tcpipsfs**

5 Establish the correct minidisk access order.

vmfsetup *ppfname compname*

where *ppfname* and *compname* are the same as described in step 4.

6 Access the TCP/IP for z/VM **SOURCE** minidisk (**4TCPIP40 2B3**, by default) or an equivalent SFS directory.

access 2b3 *fm*

where *fm* is an available file mode, perhaps "C."

D.1.2 Receive the Local Service

D.1.2.1 Create the Replacement TEXT File

Create the replacement TEXT file (or, "text deck"). How you perform this step depends on the nature of the TEXT file itself.

- If your modification is comprised of a **replacement** TEXT file, you need only to copy this file to an appropriately named file which VMSES/E can then use.
- If your modification is comprised of a **new** (additional) TEXT file, you need to copy this file to an appropriately named file and update the build list that corresponds to the module affected by your changes.

If either of the above cases are applicable, skip the steps provided for “C and Pascal Source Modifications,” and create the required `TXTmodid` file, as described in D.1.2.5, “Copy the TEXT File for Use by VMSES/E” on page 100.

- If your modification requires updates to a C or Pascal source file, continue with the steps provided for “C and Pascal Source Modifications.”

C and Pascal Source Modifications

D.1.2.2 Add an Update Record to the AUX File

- 1 Update or create the AUX file for the part being modified (*fn* AUXLCL) and add an entry for the update file; the default AUX file type is “AUXLCL.”

Note: Perform this step for each source file you need to modify.

```
xedit fn auxlcl fm-local (noprof
====> input update-ft svclvl lcmmodid comment
====> file
```

where:

- *fn* is the file name of the source-maintained part being modified.
- *fm-local* is the file mode of the TCP/IP for z/VM local modification (LOCALMOD) disk.
- *update-ft* is the file type of the update file that contains your local modifications.
- *svclvl* is a service level indicator; by convention, the string “LCL” is most often used for local modifications.
- *modid* is the local modification number (as described in Note 2 on page 96). For example: L0002
- *lcm*modid is the string “LC” concatenated with *modid*; for example: LCL0002

D.1.2.3 Create the Update File for the Part

- 1 Xedit the source file (*fn* C or *fn* PASCAL) with the CTL option.

Note: Perform this step for each source file you need to modify.

xedit *fn ft-src fm-src* (**ctl** **tcpip**

where:

- *fn ft-src fm-src* are the file name, file type and file mode of the source file you are modifying.
- **tcpip** is the name of the TCP/IP control file.

2 Make your changes to the displayed source file. The original source file is *not* changed.

3 When you have completed your changes, save them on the TCP/IP for z/VM local modification (LOCALMOD) disk. When you enter the FILE command in XEDIT, all of your changes are placed in the update file (*fn update-ft*).

====> **file** = = *fm-local*

where *fm-local* is the file mode of the TCP/IP for z/VM local modification (LOCALMOD) disk.

D.1.2.4 Create an Updated Replacement TEXT File

1 Compile the source to include your updates. Use the VMFC EXEC to compile C source files; use the VMFPAS EXEC to compile PASCAL source files. For more information about the VMFC and VMFPAS execs, see the chapter titled “Using Source Code Libraries,” of *z/VM: TCP/IP Level 440 Planning and Customization* (SC24-6019).

Note: Perform this step for each source file you have modified.

a To compile **C**-based source files, issue:

vmfc *fn tcpip* (*options*

OR

b To compile **Pascal**-based source files, issue:

vmfpas *fn tcpip* (*options*

where:

- *fn* is the name of the source file to be compiled.
- **tcpip** is the name of the TCP/IP control file.
- *options* are C or PASCAL compiler options required for your environment.

After successful completion of the VMFC (or VMFPAS) EXEC, a text file (*fn* TXTLCL A) incorporating your local modifications will exist.

Note: If you choose to use a different compilation method instead of using the VMFC or VMFPAS execs provided with TCP/IP for z/VM, the resulting TEXT file may be named differently than “*fn* TXTLCL.”

End of C and Pascal Source Modifications

D.1.2.5 Copy the TEXT File for Use by VMSES/E

Copy the replacement or new TEXT file (or, “text deck”) to the TCP/IP for z/VM local modification (LOCALMOD) disk, with the correct file type for the replacement part.

Note: Perform this step for each TEXT file affected by your modifications.

vmfrepl *fn text ppfname compname fn ft-txt fm-txt* (**\$select logmod modid outmode localmod ftabbr txt**)

where:

- *fn* is the file name of the TEXT file in question.
- *ppfname* and *compname* are the same as described in step 4 on page 97.
- *fn ft-txt fm-txt* are the file name, file type and file mode of the TEXT file in question.
- *modid* is the local modification number (as described in Note 2 on page 96). For example: L0002
- **localmod** is the symbolic name for the local modification disk in the :MDA. section of the 4TCPIP40 PPF file.

D.1.3 (Optional) Modify the Build List for Added TEXT Files

If your local modifications do not require the addition of a new TEXT file, skip the steps provided in “Additional Steps for Adding a New TEXT File,” and continue with the steps provided in D.1.4, “Rebuild the Modified Objects” on page 103.

If your local modifications are implemented within a unique TEXT file (that is, one not supplied by IBM as part of TCP/IP for z/VM) you need to perform additional steps for this TEXT file to be incorporated by the affected TCP/IP module. These steps, provided in “Additional Steps for Adding a New TEXT File,” implement build

list changes that will accommodate the new TEXT file; they would also be required if you find it necessary to replace an IBM-supplied TEXT file with one of a different name.

Additional Steps for Adding a New TEXT File

D.1.3.1 Add an Update Record to the Build List AUX File

- 1 Update or create the build list AUX file (*fn-blst* AUXLCL) and add an entry for the update file; the default file AUX file type is “AUXLCL.”

A complete list of TCP/IP for z/VM build lists is provided in Appendix F, “TCP/IP for z/VM Build Lists” on page 107.

```
xedit fn-blst auxlcl fm-local (noprof
====> input update-ft svclvl lcmovid comment
====> file
```

where:

- *fn-blst* is the file name of the build list used to build the affected module (that is, the build list to which the new TEXT file must be added).
- *fm-local* is the file mode of the TCP/IP for z/VM local modification (LOCALMOD) disk.
- *update-ft* is the file type of the update file that contains your local modifications.
- *svclvl* is a service level indicator; by convention, the string “LCL” is most often used for local modifications.
- *modid* is the local modification number (as described in Note 2 on page 96). For example: L0002
- *lcmovid* is the string “LC” concatenated with *modid*; for example: LCL0002

D.1.3.2 Create the Update File for the Build List

- 1 Xedit the build list source file with the **CTL** option.

xedit *fn-blst* **\$exec** *fm-src* (ctl **tcpip**

where:

- *fn-blst* and *fm-src* are the file name and file mode of the build list file you are modifying.
- **\$exec** is the file type of the build list.
- **tcpip** is the name of the TCP/IP control file.

2 Make your changes to the displayed source file. The original source file is *not* changed.

Locate the :OBJNAME. tag associated with the name of the module that will include your text file. For example, TCPIP.MODULE. Add a new :PARTID. tag record after the last :PARTID. tag for this object (TCPIP.MODULE), and before its :EOBJNAME. tag.

The new :PARTID. tag should define the file name of the text file you're adding, followed its file type abbreviation, TXT. Use only a single space to separate the tag, the text file name, and the TXT abbreviation, as follows

```
:PARTID. newtxtfn TXT
```

In the example that follows, the TCPBLM91 build list is to be updated to add TEXT files to the TCPIP module. To do this, line 176 is copied (or duplicated); then, in the newly created line(s), the string "TCOFFPR" is changed to the name of the added TEXT file(s).

```
TCPBLM91 EXCnnnnn I2 V 80 Trunc=80 Size=265 Line=178 Col=1 Alt=nn
====>
00087 :EOBJNAME.
00088 *
00089 :OBJNAME. TCPIP.MODULE AMODE 31 FROM TCPIP NOMAP
00090 :BLDREQ. TCPBLCOM.BLDLIST TCPBL492.TCPASCAL.TXTLIB TCPBL492.TCPLAN
00091          TCPBL492.TCPXXA.TXTLIB
00092 :GLOBAL. TXTLIB COMMTXT TCPXXA TCPASCAL TCPLANG
00093 :OPTIONS. CLEAR NOAUTO RLDSAVE NOLIBE NOUNDEF RMODE 24
00094 :PARTID. TCPIP TXT
00095 ----- 80 line(s) not displayed -----
00175 :OPTIONS. LIBE UNDEF RESET VSPASCAL
00176 :PARTID. TCOFFPR TXT
00177 :EOBJNAME.
00178 *
```

3 When you have completed your changes, save them on the TCP/IP for z/VM local modification (LOCALMOD) disk. When you enter the FILE command in XEDIT, all of your changes are placed in the update file (*fn-blst update-ft*).

====> **file** = = *fm-local*

where *fm-local* is the file mode of the TCP/IP for z/VM local modification (LOCALMOD) disk.

D.1.3.3 Create the Updated Replacement Build List

- 1 Create a replacement part from the build list \$EXEC (source) file. To do this, update the build list file with the VMFEXUPD command.

vmfexupd *fn-blst* **exec** *ppfname compname* (**outmode localmod \$select logmod**

where:

- *fn-blst* is the file name of the build list being updated. For example, TCPBLM91
- *ppfname* and *compname* are the same as described in step 4 on page 97.

The VMFEXUPD command records the update for the build list in the local version vector table (VVTLCCL), adds the update to the \$SELECT file, and creates the replacement part (*fn-blst* EXEC).

End of Additional Steps for Adding a New TEXT File

D.1.4 Rebuild the Modified Objects

Note

When you have completed the steps described in D.1.2, “Receive the Local Service” through D.1.2.5, “Copy the TEXT File for Use by VMSES/E” (or D.1.3.3, “Create the Updated Replacement Build List”) for all of the local modifications necessary for this component, then rebuild the modified objects.

In general, your modification is likely to require other steps associated with the service process to be completed (such as updating the build status table, re-building serviced objects, testing service, and copying the service into production). To complete the service process, continue with one of the steps listed, as appropriate:

- 7.2.2.4, “Update the Build Status Table” on page 56, to complete TCP/IP for z/VM RSU service
- 7.2.3.4, “Update the Build Status Table” on page 65, to complete TCP/IP for z/VM COR service

For reference, a sample VMFBLD command is shown below that can be used to rebuild specific objects within a given build list:

vmfbld **ppf** *ppfname compname fn-blst fn-mod.module* (**serviced**

where:

- *ppfname* and *compname* are the same as described in step 4 on page 97.

- *fn-blst* is the appropriate TCP/IP for z/VM build list file name. A complete list of TCP/IP for z/VM build lists is provided in Appendix F, “TCP/IP for z/VM Build Lists” on page 107.
- *fn-mod* is the file name of module which incorporates the TEXT file that has been modified.

Also, if you have modified only one module, you may want to manually copy it into production, instead of using the TCP2PROD EXEC. If this is the case, use the VMFCOPY command that follows:

```
vmfcopy fn module fm-bld = = fm-prd (oldd repl sprodid 4tcpip40%tcpip prodid 4tcpip40%tcpip
```

where:

- *fn* is the name of the modified module.
- *fm-bld* is the file mode of the TCP/IP for z/VM build disk on which the module was built.
- *fm-prd* is the file mode of the TCP/IP for z/VM production disk where the module should reside.

The VMFCOPY command will update the VMSES/E PARTCAT file on the appropriate TCP/IP for z/VM production minidisk.

Appendix E. Modifying TCP/IP for z/VM VMNFS Code

This appendix provides information to assist you in making local modifications to the TCP/IP for z/VM NFS server module (VMNFS). Modifications would be required for the NFS server to:

- use of a file handle encryption subroutine different from that in NFSFHCIP ASSEMBLE
- validate SMSG requests in a manner different from its current implementation (affects NFSSMSG C)
- report failed minidisk link attempts in a manner different from its current implementation (affects NFSBADPW C).

Certain modifications may also require changes to the TCPBLC91 EXEC, which is the build list used to build the VMNFS module.

Note: TCP/IP source files are distributed as part of the z/VM Version 4 Release 4.0 System DDR. These files reside on the TCP/IP for z/VM **SOURCE** minidisk (**4TCPIP40 2B3**, by default), or an equivalent SFS directory.

For detailed information about installing and maintaining local modifications, see Chapters 5, 6, and 7 of the *z/VM: Service Guide* (GC24-5993).

E.1 Modifying the NFSHCHIP ASSEMBLE and TCPBLC91 EXEC Files

If you need to modify the NFSHCHIP ASSEMBLE or TCPBLC91 EXEC files, you should follow the steps provided in Chapter 6, “Procedures for Local Service” of the *z/VM: Service Guide* (GC24-5993). In so doing, the following substitutions may need to be made:

- **zvm** should be: **4tcpip40**
- *compname* should be: **tcpip** or **tcpipsfs**
- *appid* should be: **4tcpip40**
- *fm-local* should be the file mode of the 2C4 minidisk
- *fm-applyalt* should be the file mode of the 2A6 minidisk

You may also find some of the information provided in Appendix D, “Making Local Modifications to TCP/IP for z/VM Modules” on page 95 to be useful, such as the steps provided in D.1.1, “Prepare for Local Service.”

Keep in mind that when you get to the following step in the *z/VM: Service Guide*:

- “Rebuilding Objects”

you should return to using this program directory and continue with 7.2.2.4, “Update the Build Status Table” on page 56.

E.2 Modifying VMNFS C Source Files

If you need to modify the source for the NFSSMSG or NFSBADPW C files, use the information provided in Appendix D, “Making Local Modifications to TCP/IP for z/VM Modules” on page 95, especially that which is specific to “C and Pascal Source Modifications.”

Appendix F. TCP/IP for z/VM Build Lists

This appendix provides a complete list of the VMSES/E build lists used to maintain TCP/IP for z/VM. This information has been provided to help you determine which build list to use with VMSES/E commands when you need to build or service specific TCP/IP objects, and to assist you with making local modifications. For more information about build list content and formats, see the *z/VM: VMSES/E Introduction and Reference (GC24-5994)*.

The build lists identified in the tables that follow can be found on the 4TCPIP40 2B2 (BASE1) minidisk. However, before using the information within a given build list, the 4TCPIP40 2D2 (DELTA) minidisk should be checked for a more current, serviced counterpart; this will ensure the most current build list file is referenced.

Also, note that the minidisks shown under the "Build String" headings are 4TCPIP40 minidisk defaults. If a PPF override has been used in your environment to change Build String minidisks or SFS directories, use your values when you determine which files are affected by a build list.

F.1 TCP/IP for z/VM Build Lists

Figure 19 lists the VMSES/E build lists used for TCP/IP for z/VM, and provides general information about the objects (files) managed by each:

<i>Figure 19 (Page 1 of 2). VMSES/E Build Lists - TCP/IP for z/VM</i>			
Build List Name	VMSES/E Part Handler	Build String (Minidisk)	Build List Description / Affected Objects
TCPBL491	VMFBDCOM	BUILD1 (491)	Full-replacement objects built to the 491 minidisk
TCPBL492	VMFBDCOM	BUILD3 (492)	Full-replacement objects built to the 492 minidisk
TCPBLHLP	VMFBDCOM	BUILD8 (29D)	TCP/IP CMS Help Files for z/VM 19D Help minidisk
TCPBLALL	VMFBMLB	BUILD3 (492)	ALLMACRO MACLIB build list

TCKBLBPL	VMFBDTLB	BUILD3 (492)	BPLDBM TXTLIB build list
TCKBLC91 (1*)	VMFBDMOD	BUILD1 (491)	Kerberos C-based MODULE objects built to the 491 minidisk
TCKBLC92 (1*)	VMFBDMOD	BUILD3 (492)	Kerberos C-based MODULE objects built to the 492 minidisk

Notes:

1. Language Environment for z/VM support must be available when building objects identified in this build list.

Appendix G. Moving TCP/IP for z/VM to SFS Directories

By default, TCP/IP for z/VM is installed to minidisks as part of the z/VM Version 4 Release 4.0 System DDR, during the initial install of z/VM Version 4 Release 4.0 itself. However, you can move certain TCP/IP for z/VM minidisks — the **service** minidisks — to Shared File System (SFS) directories. Refer to Figure 11 in 5.3.1, “DASD Requirements for TCP/IP for z/VM” on page 32 to see which minidisks can reside in SFS space. When service disks are moved to SFS directories, you can use either the default file pool (VMSYS) or a file pool of your choosing.

A summary of the steps necessary to move TCP/IP for z/VM service minidisks to SFS space are:

- Allocate space in the user-defined (or default) file pool
- Provide the installation user ID, 4TCPIP40, access to the file pool
- Create the necessary TCP/IP for z/VM subdirectories
- Copy files from minidisks to the new SFS subdirectories
- Create a PPF override, if not using default file pool or subdirectory names.

Where to Next

You need to do one of the following:

- To place TCP/IP for z/VM into SFS directories using **4TCPIP40 PPF file defaults**, you need to continue with instructions in the *z/VM: CP Command and Utility Reference* that provide information about using the **MOVE2SFS** command to move z/VM components to SFS Directories.
- To place TCP/IP for z/VM into your own **user-defined file pool or SFS directories**, continue with the instructions in G.1.1, “Setup the SFS File Pool and Required Directories” on page 110.

After you have chosen one of the previous options and completed the steps required (whether provided in this appendix or in the *z/VM: CP Command and Utility Reference*) you need to return to 6.2.2.1, “Configure TCP/IP for z/VM for Your Installation” on page 43 and complete the installation of TCP/IP for z/VM.

G.1.1 Setup the SFS File Pool and Required Directories

Notes:

1. The steps that follow help you determine TCP/IP for z/VM file pool space requirements, enroll the 4TCPIP40 user ID in a file pool, and define the required SFS directories. If not all of these steps are required — for example, you are changing only SFS directory names — adapt these instructions as needed for your environment.
2. The steps that follow assume the use of a user-defined SFS file pool name; if you are using the z/VM default file pool name (VMSYS), you should substitute “VMSYS” in place of the text “user-defined file pool” or the variable *userfilepool*, when appropriate.
3. For information about planning for, generating, and managing a file pool and server, see *z/VM: CMS File Pool Planning, Administration, and Operation* (SC24-5949).

- 1** Determine the number of 4K blocks required for your SFS directories by adding up the 4K block requirements for each SFS directory you plan to use. If you intend to use *all* of the TCP/IP for z/VM SFS directory defaults, the 4K block requirements are summarized in Figure 11 on page 32.

This information will be used when the 4TCPIP40 user ID is enrolled in the user-defined file pool.

- 2** Enroll user 4TCPIP40 in the user-defined file pool, using the ENROLL USER command:

```
ENROLL USER 4TCPIP40 userfilepool: (BLOCKS blocks)
```

where *blocks* is the number of 4K blocks you calculated in the previous step.

Note: This must be done from a user ID that is an administrator for the user-defined file pool.

- 3** Determine if there are enough blocks available in the file pool to accommodate TCP/IP for z/VM. This information can be obtained via the QUERY FILEPOOL STATUS command. Near the end of the output from this command is a list of minidisks in the file pool and the number of blocks free. If the number of blocks free is smaller than the total number needed to install TCP/IP for z/VM, you need to add space to the file pool before you continue with this process. See *z/VM: CMS File Pool Planning, Administration, and Operation* for information about adding space to a file pool.

- 4 Use the CREATE DIRECTORY command to create the required subdirectories; the default subdirectories are listed in Figure 11 on page 32. If necessary, refer to the *z/VM: CMS Command and Utility Reference* for more information about the CREATE DIRECTORY command.

```
set filepool userfilepool:  
create directory dirid  
create directory dirid
```

dirid is the name of the SFS directory you're creating, such as the default names:

```
create directory userfilepool:4tcPIP40.tcpip  
create directory userfilepool:4tcPIP40.tcpip.local  
create directory userfilepool:4tcPIP40.tcpip.delta  
create directory userfilepool:4tcPIP40.tcpip.applyalt  
create directory userfilepool:4tcPIP40.tcpip.applyprod  
create directory userfilepool:4tcPIP40.tcpip.object
```

- 5 If you intend to use an SFS directory as the work space for the 4TCPIP40 user ID, include the following IPL control statement in the 4TCPIP40 directory entry (after the INCLUDE TCPCMSU statement):

```
IPL CMS PARM FILEPOOL userfilepool
```

This will cause CMS to automatically access the 4TCPIP40's top directory as file mode A.

G.1.2 Copy Minidisk Files to SFS Directories

- 1 Copy the files from the TCP/IP for z/VM minidisks (or from the VMSYS file pool, if TCP/IP for z/VM is already installed there) to your new user-defined SFS file pool and directories, using the VMFCOPY command.

Note: Repeat the ACCESS and VMFCOPY commands that follow for each minidisk you need to copy. If necessary, see Figure 11 on page 32 for TCP/IP for z/VM default minidisk device numbers and SFS directory names.

```
access vdev e  
access dirid f  
vmfcopy * * e = f (prodid 4tcPIP40%tcpip olddate replace
```

where:

- *vdev* is the minidisk from which you are copying files.
- *dirid* is the name of the (target) SFS directory to which you are copying files.
- **4tcpip40%tcpip** is the PRODID defined within the 4TCPIP40 PPF file, for both the minidisk and SFS components of TCP/IP for z/VM.

The VMFCOPY command will update the VMSES PARTCAT file on the target directory.

G.1.3 Create a Product Parameter File (PPF) Override

This section provides information to help you create a product parameter file (PPF) override. The example used in this section changes the name of the SFS file pool where TCP/IP for z/VM files reside. See the *z/VM: VMSES/E Introduction and Reference* for more information about PPF file overrides.

Note: Do **not** directly modify the product-supplied 4TCPIP40 \$PPF or 4TCPIP40 PPF files to change the VMSYS file pool name or any other installation parameters. If the 4TCPIP40 \$PPF file is serviced, the existing \$PPF file will be replaced, and any changes to that file will be lost. By creating your own \$PPF override, your updates will be preserved.

The following process describes changing the TCP/IP for z/VM default file pool name from “VMSYS” to “MYPOOL1”:

- 1 Create a new \$PPF override file or edit an existing override file.

xedit *overname* \$ppf *fm*2

overname is the PPF override file name (such as "mytcpip") that you want to use.

fm is an appropriate file mode. If you create this file yourself, specify a file mode of A.

If you modify an existing override file, specify a file mode of A or D, based on where the file currently resides (A being the file mode of a R/W 191 minidisk, or equivalent; D, that of the MAINT 51D minidisk).

- 2** Create (or modify as required) the Variable Declarations (:DCL.) section for the **TCPIPSFS** override area so it resembles the :DCL. section that follows:

```

:OVERLIST. TCPIPSFS
:TCPIPSFS. TCPIP 4TCPIP40
*
*=====
* Override for TCPIPSFS SFS Component -- File Pool Name Change      *
*=====
:DCL. UPDATE
&191  DIR  MYPOOL1:4TCPIP40                * A-disk
&LMODZ DIR  MYPOOL1:4TCPIP40.TCPIP.LOCAL   * Local modifications
&DELTZ DIR  MYPOOL1:4TCPIP40.TCPIP.DELTA   * Product service
&APPLX DIR  MYPOOL1:4TCPIP40.TCPIP.APPLYALT * AUX and Inv files (ALT)
&APPLZ DIR  MYPOOL1:4TCPIP40.TCPIP.APPLYPROD * AUX and Inventory file
&BAS1Z DIR  MYPOOL1:4TCPIP40.TCPIP.OBJECT  * Base disk
&BAS2Z DIR  MYPOOL1:4TCPIP40.TCPIP.SOURCE  * Source code (Optional)
:EDCL.
:END.

```

This override will update the TCPIPSFS override area :DCL. section of the 4TCPIP40 \$PPF file.

- 3** Save your changes when they are complete.

====> file = = *fm*

where *fm* is the file mode where your override file resides (or A if you are creating one).

- 4** If your \$PPF override file was created at file mode A, copy it to file mode D — the Software Inventory minidisk (MAINT 51D).

copyfile *overname* \$ppf *fm* = = d (olddate

- 5** Compile your changes to create the usable PPF file, ***overname* PPF**.

vmfppf *overname* tcpipsfs

where *overname* is the file name of your \$PPF override file.

Now that the ***overname* PPF** file has been created, specify “*overname*” instead of “4TCPIP40” as the PPF name to be used for any VMSES/E commands that require a PPF name.

Appendix H. Copying TCP/IP for z/VM Client Code to the Y-Disk

To simplify access to TCP/IP client functions for your user community, you may find it desirable to copy all, or a subset of, TCP/IP for z/VM client code to the z/VM Product Code minidisk (typically the MAINT 19E minidisk, or the **Y-disk**). Doing so will avoid the need for users to additionally link and access the TCPMAINT 592 minidisk.

As well, applications that use certain programming interfaces may require TCP/IP-specific information to be available for proper operation. For example, information defined in the TCPIP DATA file is referenced by:

- the C run-time library sockets support to correctly identify the TCP/IP virtual machine. See the *C/C++ for z/VM Run-Time Library Reference* (SC09-7624) for more information.
- the VMTCPDPT routine, which resides in the VMMLIB TXTLIB that is associated with the VMLIB Callable Services Library (CSL). See the *z/VM: CMS Callable Services Reference* (SC24-6004) for more information about the VMTCPDPT CSL routine.
- various functions provided as part of the CMS REXX Socket library. See the *z/VM: REXX/VM Reference* (SC24-6035) for more information.

To copy TCP/IP for z/VM client files to the Product Code minidisk, use the following procedure **after** you have installed TCP/IP for z/VM.

Warning - Cross-Component File Overlap Considerations

Before you copy *any* TCP/IP for z/VM client files to the Y-disk (or a similar *common use* minidisk), you should first determine whether any conflicts exist between the TCP/IP client files you choose to copy, and those present on the target (Y-disk) minidisk. If any file conflicts are found, these should be addressed and resolved with respect to your installation environment before you continue with the procedure that follows.

Notes:

1. You will need to repeat this procedure each time you apply service to TCP/IP for z/VM.
2. Use discretion when wildcards (*) are used for both the *fn* (file name) and *ft* (file type) parameters of the VMFCOPY commands shown in this section, since files that exist on the Y-disk can be replaced with similarly-named TCP/IP counterpart files. The overlay of certain files may be warranted in some cases, and may be undesirable for others.

An example of this latter case is cited here. Both TCP/IP for z/VM and the Language Environment for z/VM have several **H** files that are identically named, but differ in content. These files are:

FCNTL	H	IF	H	IN	H	INET	H
IOCTL	H	NETDB	H	RESOURCE	H	SOCKET	H
STRINGS	H	TTYDEV	H	TYPES	H	UIO	H

An overlay of Language Environment for z/VM **H** files (those already present on the Y-disk) by their TCP/IP counterparts may create problems when applications are developed or rebuilt that expect (and rely upon) the content of Language Environment for z/VM files.

3. Before copying TCP/IP for z/VM files to another minidisk, ensure adequate storage space is available to maintain the files you have selected.

- 1** Log on the **MAINT** (or equivalent) user ID.

- 2** Process TCP/IP for z/VM files used by or available to TCP/IP clients.

link tcpmaint 592 592 rr
access 592 e
access 19e f

Note: If the Y-disk is not defined as the 19E minidisk in your environment, substitute the appropriate device number for this minidisk.

vmfcopy *fn ft e = = f2* (olddate replace sprodid 4tcpip40%tcpip prodid 4tcpip40%tcpip

The VMFCOPY command will update the VMSES/E PARTCAT file on the Y-disk.

Wildcards (*) can be substituted for *fn* (file name) and *ft* (file type), but should be used with discretion.

- 3** (Optional) Erase any TCP/IP for z/VM files that you do not want to remain on the Y-disk — for example, any MAP files that correspond to TCP/IP for z/VM modules re-built during service. Refer to the VMSES/E PARTCAT file on Y-disk to determine which files are associated with TCP/IP for z/VM.

Note: Additional information about managing TCP/IP for z/VM client files, as well as their association with specific TCP/IP functions, is available on-line via the TCP/IP for z/VM home page on the World Wide Web. The URL for this home page is:

<http://www.vm.ibm.com/related/tcpip/>

vmferase file *filename filetype f*

See the *z/VM: VMSES/E Introduction and Reference* for more information about the VMFERASE command and options that may help you remove specific files.

- 4 Re-save the CMS saved system, to return the Y-disk to shared status. See the “Placing (Serviced) Components into Production” section of the *z/VM: Service Guide* for detailed information about how to save the CMS saved system.
